Product Catalog

Packaged Rooftop Air Conditioners
IntelliPak™ 2

90 – 150 Tons — Air-Cooled Condensers
100 – 162 Tons — Evaporative Condensers

April 2017

RT-PRC027V-EN

Introduction

IntelliPak™ 2 Rooftops Designed For Today, Tomorrow and Beyond

Built on the legacy of Trane's industry leading IntelliPak, the IntelliPak 2 90 to 162 ton platform is designed for the future. Expanded features and benefits, controls enhancements and world class energy efficiencies make the IntelliPak 2 the right choice for demanding applications today, and tomorrow. Trane's rooftop unit control modules (UCM), an innovative array of microprocessor controllers, coordinates the actions of the IntelliPak 2 rooftop for reliable and efficient operation and allows for standalone operation of the unit.

Access to the unit controls, via a Human Interface Panel, provides a high degree of control, superior monitoring capability, and unmatched diagnostic information.

Optionally, for centralized building control on-site, or from a remote location, IntelliPak 2 can be configured for direct communication with a Trane Tracer™ or a 3rd party building management system using LonTalk® communication protocol, BACnet® control network or AirFi™ wireless system. With any of these systems, the IntelliPak 2 operating status data and control adjustment features can be conveniently monitored from a central location.

The Trane IntelliPak 2 has the technology and flexibility to bring total comfort to every building space.

Note: *AHRI certifies up to 63 Ton units, all air-cooled units over 63 tons are tested in accordance with the code.*

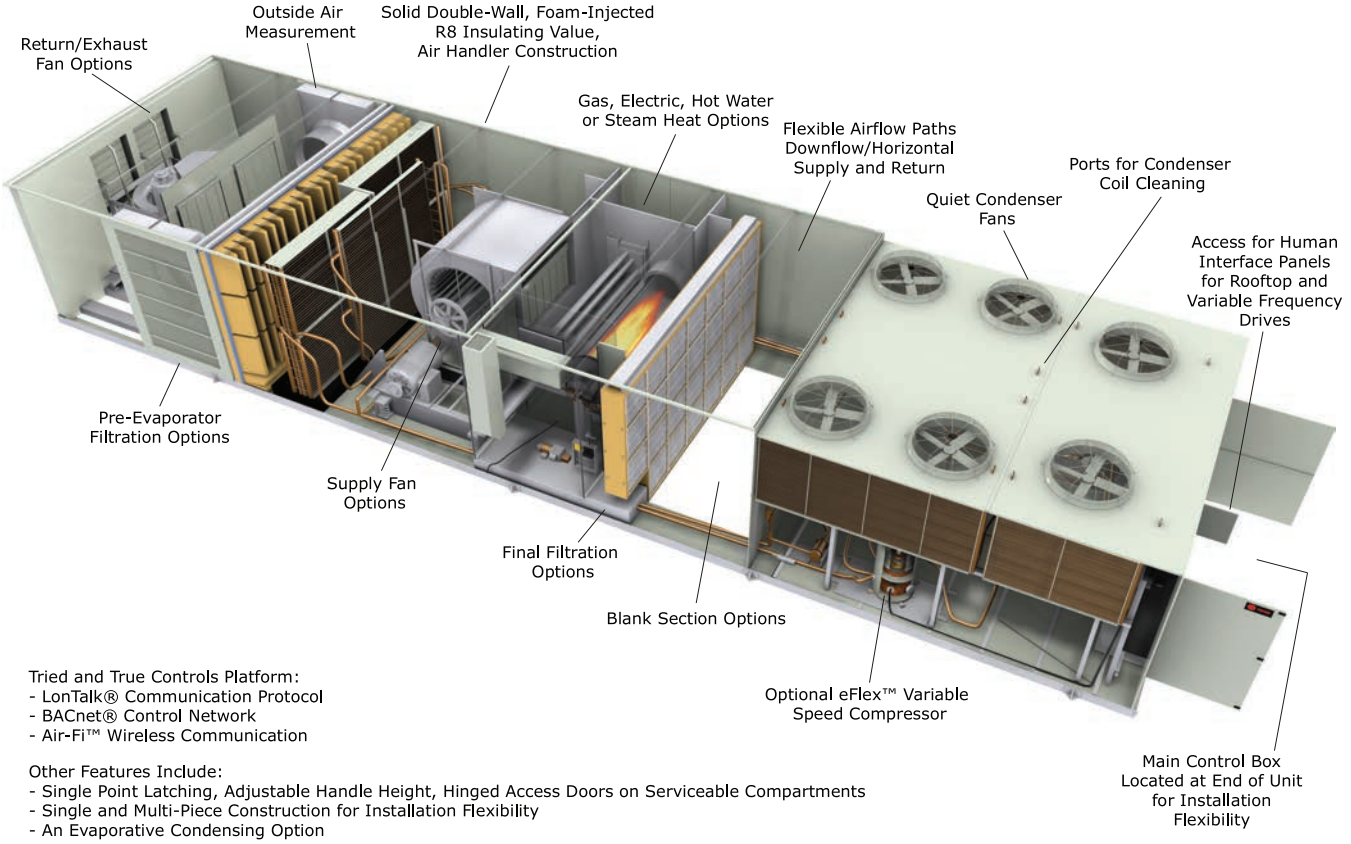
Revision History

- Updated liquid line information.
- Running changes included.

Table of Contents

Features & Benefits

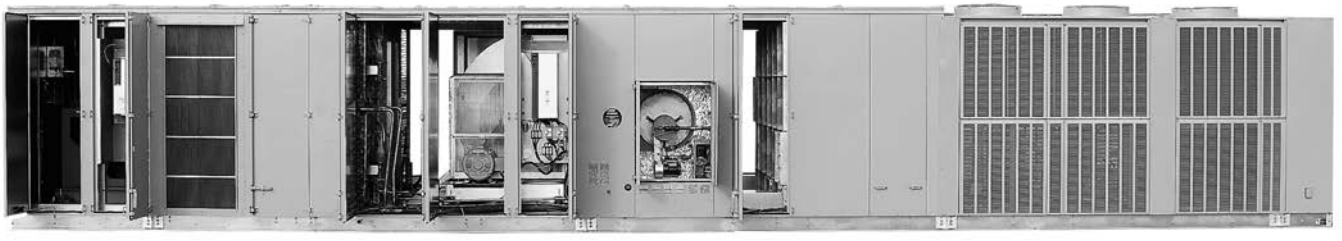
Figure 1. IntelliPak features



Tried and True Controls Platform:
- LonTalk® Communication Protocol
- BACnet® Control Network
- Air-Fi™ Wireless Communication

Other Features Include:
- Single Point Latching, Adjustable Handle Height, Hinged Access Doors on Serviceable Compartments
- Single and Multi-Piece Construction for Installation Flexibility
- An Evaporative Condensing Option

Figure 2. Standard unit with 8 ft blank space—panels removed



Standard Features

Figure 3. Human Interface panel

Figure 4. Solid double wall

Figure 5. Latching access door

Figure 6. Spring isolation

- 90 to 162 ton industrial/ commercial packaged rooftops
- R-410A HFC Refrigerant
- ASHRAE 90.1 - 2010 Efficiency Compliant
- IBC (International Building Code) Seismic compliance in select configurations
- cULus approval on standard options
- OSHPD Seismic compliance in select configurations

Controls

- Fully integrated, factory installed/commissioned microelectronic controls
- Unit mounted Human Interface Panel with a 2 line x 40 character English display and a 16 function keypad that includes custom, diagnostics, and service test mode menu keys
- Low charge indication and lockout Superheat monitoring and indication on each circuit CV, VAV, or SZVAV control
- Daytime warm-up (Occupied mode) on VAV models and morning warm-up operation on all units with heating options
- Low ambient compressor lockout control on units with economizers
- Frostat coil frost protection on all units
- Supply air static over-pressurization protection on units with VFD's
- Supply airflow proving Exhaust/return airflow proving on units with exhaust or return fan options
- Supply air tempering control
- Supply air heating control on SZVAV and VAV units with heat: modulating gas, electric, steam and hot water
- Emergency stop input
- Mappable sensors and setpoint sources
- Occupied/unoccupied switching
- Timed override activation

Refrigeration

- Trane 3–D scroll compressors
- Compressor lead/lag for run- time equalization[1]
- Intertwined evaporator coil circuiting for full face area operation at part load conditions

1. *Not available with eFlex™ Variable Speed option*

- Discharge service valve

Cabinet

- Solid double wall construction with foam injected R8 insulation throughout air handler section
- Single point latching, hinged access doors on control panel, filter, supply and exhaust/return fan section as well as gas heat section
- Flexible downflow and horizontal discharge/return paths
- Double sloped galvanized drain pans
- Extended casing, cooling only models
- Pitched roof over air handler section
- Heavy-gauge, continuous construction base rails
- Meets salt spray testing in accordance to ASTM B117 Standard

Mechanical

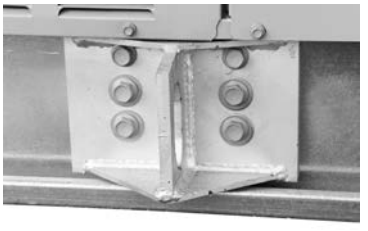
- Airfoil supply fan—standard and low CFM
- Totally enclosed condenser fan motors (TEFC)
- Stainless steel flue stack on gas heat units
- Two-inch spring fan isolation standard
- Two-inch MERV 8 high efficiency throwaway filters

Optional Features

Figure 7. Variable frequency drive

Figure 8. Traq damper

Figure 9. Convenience outlet



Controls

- Demand control ventilation (energy saving CO_2 economizer control)
- Twinning of up to four units for applications on common supply and return ducts
- Variable frequency drive (VFD) control of supply/exhaust/return fan motor
- High duct temperature thermostats
- Low ambient control to 0°F LonTalk Communication Interface module
- BACnet® Communication Interface module
- AirFi™ Wireless Comm Interface
- Rapid Restart
- Five ventilation override sequences
- Generic BAS interfaces—0-5 VDC and 0-10 VDC
- Remote Human Interface Panel (controls up to 4 units)
- SZVAV - Modulated Supply Fan for more efficient operation
- Rapid Restart - 100% cooling mode after power loss

- Fault Detection and Diagnostics (FDD)
- Supply & exhaust fan speed feedback through BCI-I

Refrigeration

- High capacity evaporator coils
- eFlex™ variable speed compressor
- Hot gas bypass to the evaporator inlet
- Suction service valves
- Modulating hot gas reheat
- Replaceable core filter driers

Cabinet

- Blank section options
  - Four foot blank—cooling only
  - Eight foot blank—cooling and heating
- Two or three-piece construction
- Single point access doors on both sides of the unit
- Double sloped stainless steel drain pans
- Belt guards for supply and exhaust/return fans
- Burglar bars on select configured units

Mechanical

- Modulating hot gas reheat
- Evaporative condensers
- Total energy recovery wheels rated in accordance to ARI Standard 1060
- Airfoil plenum return fan—standard and low CFM
- Modulating plenum return fan with Statitrac™ direct space sensing building pressurization control
- Forward curved exhaust fan—standard and low CFM
- 100 percent modulating exhaust
- 100 percent modulating exhaust with Statitrac™ direct space sensing building pressurization control
- Outside air CFM compensation on SZVAV and VAV units with VFD and economizer
- Trane air quality (Traq™) outside air measurement damper system
- 0-100% modulating outside air economizer
- 0-25% motorized outside air damper
- Low Leak, Standard Ultra Low Leak, and Ultra Low Leak AMCA 1A Economizer dampers

Filtration

- Pre-evaporator coil filter options
- Filter rack only (no filters)
- Two-inch throwaway filters
- 90-95% bag filters
- 90-95% cartridge filters
- Final filters
  - Bag filters
  - Standard and high temperature cartridge filters
  - Standard and high temperature HEPA filters

Heat Options

- Electric, gas, steam or hot water
- Gas heat options:
  - 10:1 modulating gas heat 850 MBh

  - 20:1 modulating gas heat 1100, 1800, and 2500 MBh
  - 10 year limited warranty on modulating gas heat

Electrical

- High Fault SCCR with unit interrupt rating of 65,000 amp (480V) and 25,000 amp (600V)
- Totally enclosed fan-cooled supply and exhaust/return fan motors
- Supply and exhaust/return motors with Internal Shaft Grounding Ring for VFD applications
- EISA-rated supply and exhaust/return fan motors as standard (60 Hz)
- Marine lights in serviceable compartments
- Electrical convenience outlet
- Through the door non-fused disconnect with external handle

Field Installed Accessories

- Roof curbs
- AirFi™ Wireless zone sensor
- AirFi™ Wireless Communication Interface
- Programmable sensors with night setback—CV and VAV
- Sensors without night setback— CV and VAV
- Remote zone sensors—used for remote sensing with remote panels
- ICS zone sensors used with Tracer system for zone control
- Outdoor temperature sensor for units without economizers
- Remote minimum position control for economizer
- Module kits available for field upgrade of controls

Features Summary

The IntelliPak 2 packaged rooftop air conditioner features a simplified installation process, more direct access to service ports and an extremely reliable system with multiple options to suit building requirements.

Installation and Service

- Loss of refrigerant charge diagnostics warns of a slightly undercharged situation followed by a warning and a lock out of an undercharged circuit for overall unit performance and compressor protection
- Superheat reading for each circuit displayed at the Human Interface panel to assist the service technician in troubleshooting
- Microprocessor unit controls coordinate the operation of the rooftop with quality, industry-accepted components for service ease
- Controls are factory installed/commissioned for ease of start up
- Condenser coil cleaning ports conveniently located on the roof of the condenser for efficient servicing
- Full unit points access—no field wiring of required points
- Modularity of unit control design
- Individual replaceable functional boards
- Unit mounted Human Interface Panel standard
  - User-friendly keypad edit parameters
  - Dedicated Human Interface access panel
  - Start up adjustments
  - Advanced diagnostics
- Unit-mounted and remote interface panel key pads are identical
- Single twisted wire pair communication for ICS interface
- Sturdy, double wall, foam injected, hinged access doors with height adjustable single point latches on main compartments for service ease
- Main control box conveniently located on end of unit for layout flexibility in tight spaces

- Built-in, optional features like high withstand rated breakers, belt guards and burglar bars contribute to safety
- Convenience outlet and marine lights for enhanced service capability
- Unit-mounted lifting lugs facilitate installation and can be used as unit tie-down points

Reliability

- Advanced diagnostics
- Microprocessor controls
- Built-in safeties
- Modular control design
- cULus approval as standard
- All supply, exhaust, and return fans are factory balanced
- Fully insulated floor, roof, panels, and gasketed interfaces reduce ambient air infiltration.
- Fixed-speed evaporator, exhaust/return drives for smooth fan operation and belt durability.
- 200,000 average life fan bearings enhance unit durability.
- Gas heater with free-floating stainless steel heat exchanger relieves the stresses of expansion and contraction. Stainless steel provides corrosion resistance through the entire material thickness.
- Factory-wired and commissioned controls assure efficient and reliable rooftop operation.
- Scroll compressors are designed for tough industrial operation and meet demanding operating conditions both in efficiency and reliability.
- Roll-formed construction enhances cabinet integrity and assures a leak-proof casing.
- AMCA 1A Ultra Low Leak economizer, including linkages and actuators, have a 5 year limited warranty and functional life of 60,000 opening and closed cycles.
- AMCA 1A Ultra Low Leak Economizer includes Fault Detection Diagnostics (FDD) to signal the IntelliPak controls for economizer faults.
- Three-phase, direct-drive totally enclosed condenser fan motors enhance dependability and increase rooftop life.
- Trane industrial quality evaporator and condenser coils help increase rooftop life.
- eFlex™ variable speed compressors are designed to modulate refrigerant flow achieving outstanding part load ratings (IEER)

Application Flexibility

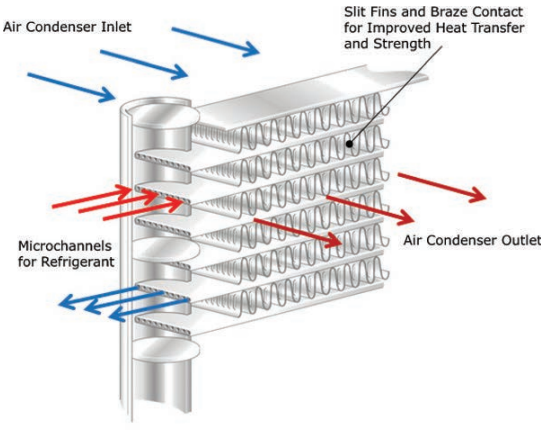
- Low CFM fans for low leaving air temperature applications
- Multiple downflow and horizontal air path options
- An array of heating options are available, including electric, natural gas, steam and hot water. The gas heating option provides a choice of two-stage gas heat, as well as full modulating gas heat. Electric heating options provide four to six steps of capacity.
- Variable speed compressors are designed to modulate refrigerant flow achieving outstanding partial load ratings (IEER).
- Indoor Air Quality (IAQ)
  - Traq™ Damper System for precise outside air measurement
  - Demand Control Ventilation for CO_2 economizer control
  - Compensated outdoor air control
  - Statitrac™ direct space building pressure control
  - Multiple factory installed filter types, pre evaporator and final filters
  - Humidification control output
  - Comparative enthalpy, reference enthalpy, or dry bulb control for economizers
- Superior building automation interface through LonTalk®
- Superior building automation interface through BACnet®
- Generic BAS interfaces
- Unit mounted or Remote Human Interface panels
- All parameters are editable from the Human Interface Panel
- Five factory preset ventilation override sequences which can be redefined in the field
- Variable Frequency Drives (VFD) included with or without bypass control for supply and exhaust/return fans

- Constant Volume (CV) controls stage both compressors and heat based on space requirements

Microchannel Condenser Coil

Microchannel condensing coils are all-aluminum coils with fully-brazed construction. This design reduces risk of leaks and provides increased coil rigidity — making them more rugged on the jobsite. Their flat streamlined tubes with small ports and metallurgical tube-to-fin bond allow for exceptional heat transfer. Microchannel all-aluminum construction provides several additional benefits:

- Light weight (simplifies coil handling)
- Easy to recycle
- Minimize galvanic corrosion



Energy Savings, Improved IAQ and Comfort

IntelliPak offers several ways to save energy while improving indoor air quality (IAQ) and zone comfort. Standard factory installed options for energy savings include, but are not limited to, modulating hot gas reheat, eDrive™, eFlex™ and evaporative condensers.

Single Zone VAV (SZVAV)

Single Zone VAV (SZVAV) is designed for use in single zone applications such as gymnasiums, auditoriums, manufacturing facilities, retail box stores, and any large open spaces where there is a diversity in the load profile. It is an ideal replacement to "yesterday's" constant-volume (CV) systems, as it reduces operating costs while improving occupant comfort.

SZVAV systems combine Trane application, control and system integration knowledge to exactly match fan speed with cooling and heating loads, regardless of the operating condition. Trane algorithms meet and/or exceed ASHRAE 90.1- 2010 SZVAV energy-saving recommendations and those of CA Title 24. The result is an optimized balance between zone temperature control and system energy savings. Depending on your specific application, energy savings can be as much as 20+%.

Note: *Building system modeling in energy simulation software such as TRACE is recommended to evaluate performance improvements for your application.*

SZVAV is fully integrated into the control system. It provides the simplest and fastest commissioning in the industry through proven factory-installed, wired, and tested system controllers. All control modules, logic boards and sensors are factory installed and tested to ensure the highest quality and most reliable system available. This means no special programming of algorithms, or hunting at the jobsite for field installed sensors, boards, etc. SZVAV is a quick and simple solution for many applications and is available from your most trusted rooftop VAV system solution provider -Trane.

Ultra Low Leak, AMCA 1A Economizer Damper

The pre-engineered design special Ultra Low Leak AMCA 1A Economizer Damper package will meet or exceed requirements of California Title 24, ASHRAE 90.1, and IECC. The economizer, including linkages and actuators, will have a 5 year limited warranty and functional life of 60,000 opening and closed cycles.

Dampers are AMCA 511 Class 1A certified with a maximum leakage rate of 3 CFM/sq-ft at 1.0 in. WC pressure differential. As part of this package, Fault Detection and Diagnostics (FDD) control is included to meet California requirements. FDD control monitors the commanded position of the economizer compared to the feedback position of the damper. If the damper position is outside of ±10% of the commanded position, a diagnostic is generated.

Trane® Air Quality (Traq™) Outside Air Measurement System

Trane® Air Quality (Traq™) outside air measurement system uses velocity pressure sensing rings to measure airflow in the outside air opening from 40 cfm/ton to maximum airflow. Traq™ dampers are AMCA certified (+/- 5.0%) from 300fpm to 2500fpm, meeting requirements of LEED IE Q Credit 1.

eFlex™ Variable Speed Scroll Compressor

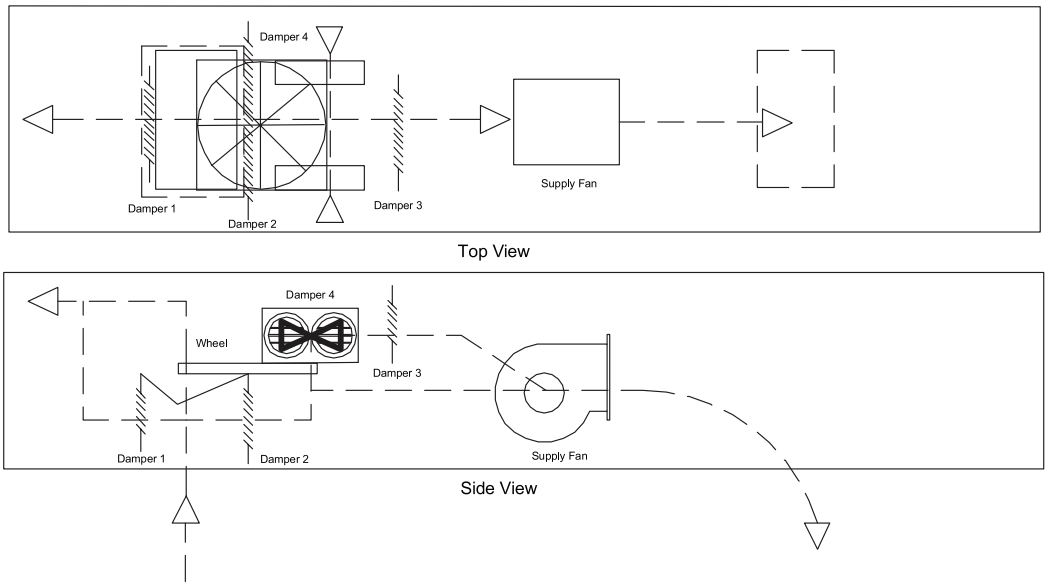
Trane® eFlex™ variable speed scroll compressors are matched with a specially designed variable frequency drive that allows a modulating ratio of up to 4:1. Our eFlex™ compressors are paired with fixed speed compressors such that the units are capable of continuous capacity modulation from 15 to 100%. By design, unit capacity stages overlap to eliminate the frequent cycling between stages typical of competing designs. This allows for unmatched control of leaving air temperatures to meet space loads. The eFlex™ compressors also include brushless permanent magnet motors designed to operate at higher efficiency along with reducing the compressor motor speed and staging results in significant part load energy savings. This makes units with eFlex™ compressors the most efficient products in their class at part load.

Energy Recovery Wheel

Because the energy recovery wheel has the capability to hold and transfer sensible and latent energy, this option can significantly reduce HVAC system operating energy costs. IntelliPak 2 offers the total energy wheel option to recover energy from the building exhaust. Benefits of the total energy recovery feature include:

- Energy efficient ventilation to reduce operating costs
- The ability to increase ventilation, allowing for improved indoor air quality (IAQ)
- High efficiency, which permits increased outdoor air quantity without increasing heating or cooling

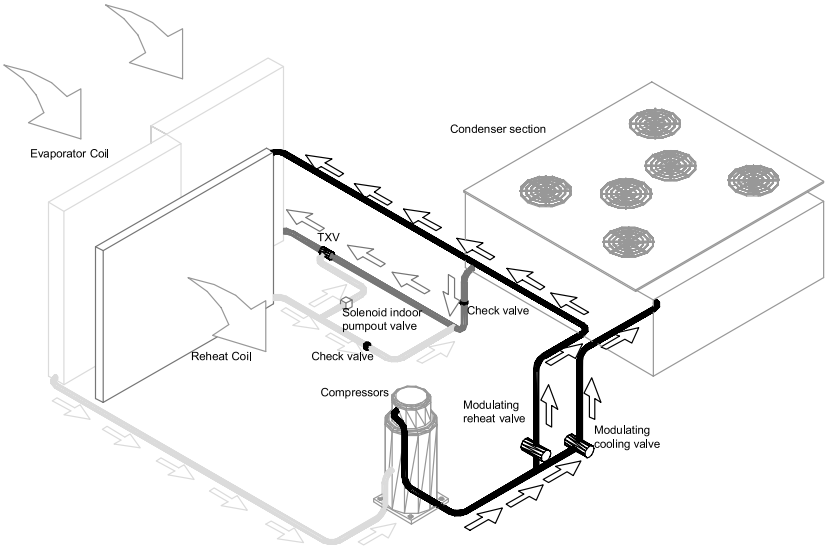
Figure 10. Energy recovery wheel in economizer mode



Modulating Hot Gas Reheat

By its very nature, the colder the air, the less moisture it contains. With hot gas reheat, the cold air that passes through the DX coil is reheated to an acceptable temperature and returned as dehumidified air to the facility space. The result is both temperature and humidity are maintained in cooling mode, while reducing unit operating costs and saving energy.

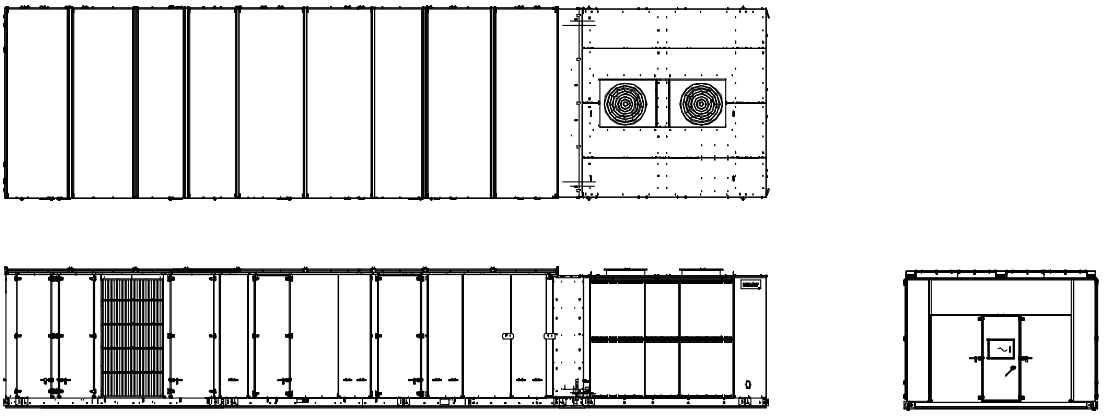
Figure 11. Hot gas reheat



Evaporative Condensing Units

Unlike air-cooled condensers, evaporative condensers are dependent on the ambient wet bulb, rather than dry bulb, temperature. Wet bulb temperature is generally several degrees lower than dry bulb. Utilizing the lower wet bulb temperature to condense refrigerant vapor can dramatically decrease compressor power consumption by reducing compressor discharge pressure, thereby increasing unit efficiency.

Figure 12. Unit top/left side view—evaporator-cooled condenser



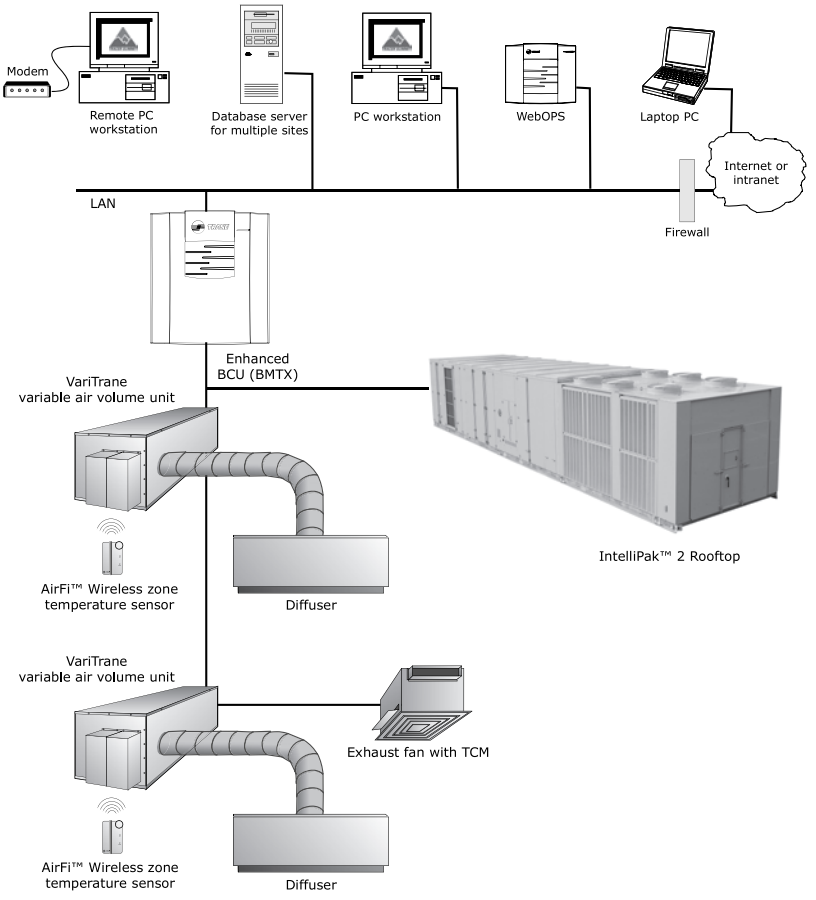
Superior Control Options

Integrated Comfort with Trane® Tracer LCI and BCI

The Tracer Integrated Comfort™ System (ICS) or System Controller (SC) improves job profit and increases job control by combining Trane rooftop units with the Trane Tracer building management system. These integrated systems provide total building comfort and control. Some of the primary motivations for building owners/managers in deciding to purchase a HVAC controls system are energy savings, cost control, and the convenience of facility automation.

Simplifying the Comfort System

Figure 13. Trane complete comfort system



Trane technology and innovation brings more capabilities, more flexibility, and offers equipment and systems that are easy to use, easy to install, commission and service. The Tracer Integrated Comfort system and System Controller save time and money by simplifying system design and system installation.

When used with Trane DDC/VAV terminals (or VariTrane), system balancing almost goes away because each VAV box is commissioned and tested before it leaves the factory. All the status information and editing data from the rooftop units, VAV terminals, lighting, exhaust and other auxiliary equipment is available from Tracer for facility control, monitoring and service support.

Tracer, a family of building automation products from Trane, is designed with robust, application specific software packages to minimize custom programming requirements and enable system setup and control through simple editing of parameters in the standard applications software. When selecting an Integrated Comfort system for a facility, the accountability for equipment, automation and controls lies with Trane. In addition to high quality, high performance, packaged rooftop equipment, Trane provides precise air delivery management with VariTrane VAV terminals. Wireless zone sensors minimize the installation costs of the VariTrane terminals and the packaged rooftop system in general.

The IntelliPak rooftop, as a part of an Integrated Comfort system or System Controller (SC), provides powerful maintenance monitoring, control and reporting capabilities. The Tracer places the rooftop in the appropriate operating mode for: system on/off, night setback, demand limiting, setpoint adjustment based on outside parameters and much more.

Many different unit diagnostic conditions can be monitored through Tracer: sensor failures, loss of supply airflow, and a compressor trip out. Further, the addition of Building Management Network software offers remote scanning, automatic receipt of alarms, and easy dial-up access to over 100 various Tracer sites across town or across the country.

Monitoring Points Available through Tracer®

- All active rooftop diagnostics
- History of last 20 unit diagnostics
- All system setpoints
- System sensor inputs
- Supply fan mode and status
- VFD speed
- Unit heat/cool mode
- Exhaust/return fan status
- Exhaust/return damper position
- Economizer position, minimum position setpoint, economizing setpoint
- Refrigerant evaporator and saturated condenser temperatures
- Electric heat stage status
- Ventilation override mode status

Tracer Control Points

Figure 14. Tracer

- On/off status of each compressor
- Sensor calibration offsets cooling and heating setpoints
- Zone setpoint offsets for use with demand limiting
- VAV discharge air setpoints
- Supply air pressure setpoint
- Space pressure setpoint
- Zone and outdoor temperature values
- Cooling and heating enable/disable
- Economizer enable/disable
- Economizer setpoint
- Economizer minimum position
- Activation of ventilation override modes
- Diagnostics reset
- Unit priority shutdown

Setup and Configuration Information through Tracer

- Supply fan mode
- Configuration of supply air reset
- Ventilation override mode configuration
- Default system setpoint values

Interoperability with LCI and BCI

Integrated Comfort with LonTalk Communication

Trane® Tracer® LonTalk™ Control Interface (LCI) for IntelliPak offers a building automation control system with outstanding interoperability benefits.

LonTalk, which is an industry standard, is an open, secure and reliable network communication protocol for controls, created by Echelon Corporation and adopted by the LonMark® Interoperability Association. It has been adopted by several standards, such as: EIA-709.1, the Electronic Industries Alliance (EIA) Control Network Protocol Specification and ANSI/ASHRAE 135, part of the American Society of Heating, Refrigeration, and Air Conditioning Engineer's BACnet® control standard for buildings.

Interoperability allows application or project engineers to specify the best products of a given type, rather than one individual supplier's entire system. It reduces product training and installation costs by standardizing communications across products. Interoperable systems allow building managers to monitor and control IntelliPak equipment with a Trane Tracer Summit or a 3rd party building automation system. It enables integration with many different building controls such as access/intrusion monitoring, lighting, fire and smoke devices, energy management, and a wide variety of sensors (temperature, pressure, light, humidity, occupancy, CO_2 and air velocity). For more information on LonMark, visit www.lonmark.org or Echelon, www.echelon.com.

Integrated Comfort with BACnet Communication

The Trane SC BACnet Control Interface (BCI-I) for IntelliPak offers a building automation control system with outstanding interoperability benefits. BACnet, which is an industry standard, is an open, secure and reliable network communication protocol for controls, created by American Society of Heating, refrigerating and Air-Conditioning Engineers, Inc. (ASHRAE)

Interoperability allows application or project engineers to specify the best products of a given type, rather than one individual supplier's entire system. It reduces product training and installation costs by standardizing communications across products. Interoperable systems allow building managers to monitor and control IntelliPak equipment with Tracer SC or a 3rd party building automation system. It enables integration with many different building controls such as access/intrusion monitoring, lighting, fire and smoke devices, energy management, and a wide variety of sensors (temperature, pressure, light, humidity, occupancy, CO_2 and air velocity).

Diagnostic Points:

- All rooftop diagnostics
- System setpoints
- System sensor inputs
- Supply fan mode and status
- VFD speed
- Unit heat/cool mode
- Exhaust/return fan status
- Exhaust/return damper position
- Economizer position, minimum position setpoint, economizing setpoint
- On/off status of each compressor
- Refrigerant evaporator and saturated condenser temperatures
- Hydronic heat valve position
- Electric heat stage status
- Ventilation override mode status

Control Points:

- Cooling and heating setpoints
- Zone setpoint offsets for use with demand limiting
- VAV discharge air setpoints
- Supply air pressure setpoint
- Space pressure setpoint
- Zone and outdoor temperature values

- Cooling and heating enable/disable
- Economizer enable/disable
- Economizer setpoint
- Economizer minimum position
- Activation of ventilation override modes
- Diagnostics reset
- Unit priority shutdown
- Timed override activation

Setup and Configuration:

- Supply fan mode
- Configuration of supply air reset
- Ventilation override mode configuration
- Default system setpoint values
- Sensor calibration offsets

Trane Air-Fi Wireless Communication

Trane Air-Fi™ wireless replaces the need for wired building controls, allowing installations to be completed quickly with less disruption to occupants in existing buildings, while also providing greater reliability, simplified installation and more flexibility as building spaces change. Many building owners face challenges connected to maintenance and repair with traditional wired systems, which fail when wires are cut or disconnected or fail intermittently when damaged. Air-Fi can help optimize any building's performance with less risk, thanks to self-repairing mesh technology that features redundant signal paths to help prevent communication failures.

Trane offers a typical 200-foot indoor signal range, with up to four times the number of paths, extending up to half-mile when unobstructed for even greater levels of signal reliability. With a battery life that's three times what competitors offer, the lifetime battery[2] eliminates the need to replace batteries over the life of the system in most installations and saves time and money. Air-Fi is a ZigBee® Certified Building Automation solution, and the system is built on a platform that supports BACnet™ open standards. This allows customers to integrate devices in the future when the building expands or changes. Wireless sensors are easy to move or replace, as needed, to resolve issues related to sensing accuracy, aesthetics or reconfigured spaces.

Trane Air-Fi wireless also conforms to the IEEE 802.15.4 standard, so customers get a wireless BAS communication system that reliably coexists with other wireless systems, including Bluetooth® and Wi-Fi™ — without interference. There's no security risk with Air-Fi, which uses a separate, secure network from those used by a building's IT system. Air-Fi secures building automation networks by the use of AES-128 encryption, keys and device authentication.

The Trane Air-Fi interface is available factory-installed and addressed to expedite installation and reduce labor and upfront costs. It also ensures higher installation quality that results in better building performance for customers because the work is done in a controlled environment, making it more repeatable and consistent. To learn more about Trane Air-Fi wireless technology, visit http://commercial.trane.com/content/trane-lp/airfi.html.

Optimum Building Comfort Control

The modular control design of the UCM allows for greater application flexibility. Customers can order exactly the options required for the job, rather than one large control package. Unit features are distributed among multiple field replaceable printed circuit boards. The Trane UCM can be setup to operate under one of three control applications:

- Standalone
- Interface with Trane Tracer building management system
- Interface with a generic (non-Trane) building management system. All setup parameters are preset from the factory, requiring less start-up time during installation

The unit mounted Human Interface and the Remote Human Interface Panels' functions are identical, with the exception of the Service mode which is not available on the Remote Human

2. *Based on typical indoor operating conditions.*

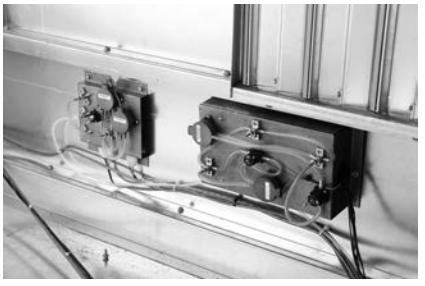
Interface Panel. This common interface feature requires less time for building maintenance personnel to learn to interact with the unit.

All rooftop control parameters are adjustable and can be setup through the Remote Human Interface Panel such as, but not limited to: system on/off, demand limiting type, night setback setpoints, and many other setpoints. No potentiometers are required for setpoint adjustment; all adjustments are done through the Remote Human Interface keypad.

Up to 56 different rooftop diagnostic points can be monitored through the human interfaces such as: sensor failures, loss of supply airflow, and compressor trip. No special tools are required for servicing the unit. All diagnostic displays are available in clear English at the Remote Human Interface and will be held in memory, so that the operator/service person can diagnose the root cause of failures.

Statitrac Direct Space Building Pressurization Control

Figure 15. Statitrac



Trane Statitrac control is a highly accurate and efficient method of maintaining building pressure control with a large rooftop air conditioner.

Building space pressurization control is achieved with a 100 percent modulating exhaust system that features a single forward curved fan, with modulating discharge dampers that operates only when needed or a 100% modulating plenum return fan with airfoil wheel that operates continuously with the supply fan. Most of the operating hours of the 100 percent modulating exhaust system are at part load, resulting in energy savings. Statitrac, with the 100 percent modulating exhaust system, provides comfort and economy for buildings with large rooftop air conditioning systems. Statitrac, with the 100% modulating plenum return fan provides comfort and space pressure control in more demanding applications with high return static pressure, and applications requiring duct returns. Statitrac control with exhaust fan is simple! The space pressure control turns the exhaust fans on and off as required and modulates exhaust dampers, or fan speed, to maintain space pressure within the space pressure deadband. Economizer and return air dampers are modulated based on ventilation control and economizer cooling request.

The unit mounted Human Interface Panel can be used to:

- Adjust space pressure setpoint
- Adjust space pressure deadband
- Measure and read building static pressure

The modulating exhaust system maintains the desired building pressure, while saving energy and keeping the building at the right pressure. Proper building pressurization eliminates annoying door whistling, doors standing open, and odors from other zones. The Statitrac direct space building control sequence will also be maintained when a variable frequency drive is used.

Statitrac Control with Plenum Return Fan is State of the Art!

Other manufacturers utilize a fan tracking control scheme whereby the return fan speed tracks the supply fan speed in a linear fashion. This scheme works well at minimum and maximum CFM airflow. However, due to the dissimilar performance characteristics of the supply and return fan, building pressure is difficult to control at points between minimum and maximum CFM airflow.

The Trane return fan/building pressurization control system eliminates the effects of dissimilar supply/return fan characteristics experienced in a linear tracking control system by modulating the exhaust dampers based on space pressure, the return/economizer dampers based on ventilation requirements, and the return fan speed based on return plenum static pressure. The

supply fan, return fan, exhaust damper, and return/economizer damper systems act independently from one another to maintain comfort and building pressure.

The return fan operates whenever the supply fan is in operation. The unit exhaust dampers are modulated in response to the space pressure signal to maintain space pressure within the space pressure deadband. The unit economizer and return air dampers are modulated based on ventilation control, minimum outside air economizer position, and economizer cooling request. The return fan speed is modulated based on a return duct static pressure deadband control. Using the unit mounted Human Interface, the operator can:

- Adjust space pressure setpoint
- Adjust space pressure deadband
- Measure and read building space pressure
- Measure and read return duct static pressure.

Proper building pressurization eliminates annoying door whistling, doors standing open, and odors from other zones.

Variable Frequency Drives (VFD)

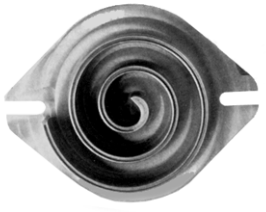
Variable Frequency Drives are factory installed and tested to provide supply/exhaust/return fan motor speed modulation. VFD's, as compared to discharge dampers, are quieter, more efficient, and may be eligible for utility rebates. The VFD's are available with or without a bypass option. Bypass control will simply provide full nominal airflow in the event of drive failure.

3-D Scroll Compressors

The Trane 3-D® Scroll provides important reliability and efficiency benefits inherent to its design. The 3-D Scroll allows the orbiting scrolls to touch in all three dimensions forming a completely enclosed compression chamber which leads to increased efficiency.

In addition, the orbiting scrolls only touch with enough force to create a seal, thereby resulting in no wear between the scroll involutes. The fixed and orbiting scrolls are made of high strength cast iron, which results in less thermal distortion and minimal leakage. In addition, better part isolation has resulted in reduced compressor sound levels compared to previous designs.

Figure 16. 3-D® scroll compressor



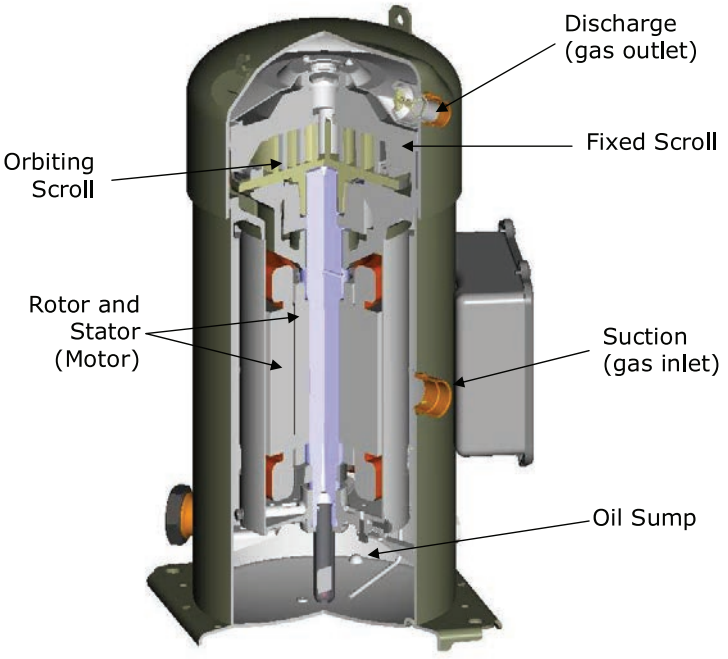
Features listed below optimize the compressor design and performance:

- Optimized scroll profile
- Heat shield protection to reduce heat transfer between discharge and suction gas
- Improved sealing between condenser side and air handler side

Additional features are incorporated in the compressor design for greater compressor reliability:

- Patented design motor cap for improved motor cooling
- Improved bearing alignment
- Improved resistance to dry start up
- Oil sight glass for evaluating proper oil levels

Figure 17. Internal view, 3-D® scroll compressor



Low Torque Variation

The 3-D Scroll compressor has a very smooth compression cycle. This means that the scroll compressor imposes very little stress on the motor resulting in greater reliability. Low torque variation reduces noise and vibration.

Suction Gas Cooled Motor

Compressor motor efficiency and reliability is further optimized with the latest scroll design. The patented motor cap directs suction gas over the motor resulting in cooler motor temperatures for longer life and better efficiency.

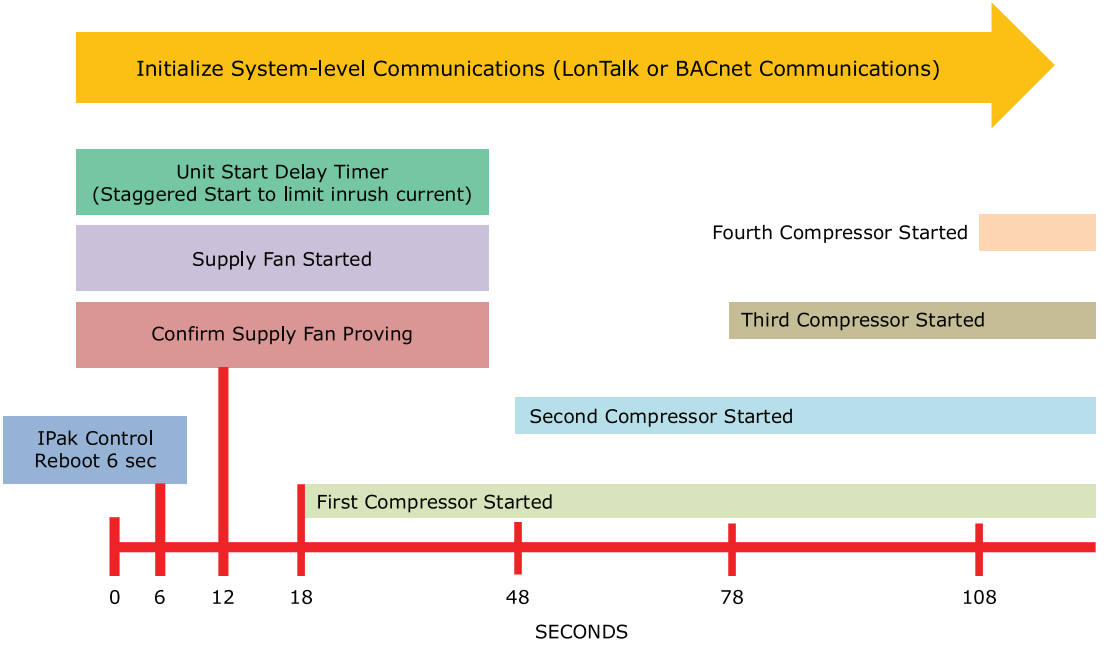
Rapid Restart

Trane understands that every second counts. Trane equipment, controls, and control sequences are designed to get the system back online and properly functioning should the facility experience a power cycle event.

- Trane HVAC system design is optimized for fast restart.
- IntelliPak Rooftop System controls and equipment provide an integrated, pre-engineered solution for fast restart.
- Proven operational procedures maximize uptime outside of critical outages and get the system up and running as quickly as possible.

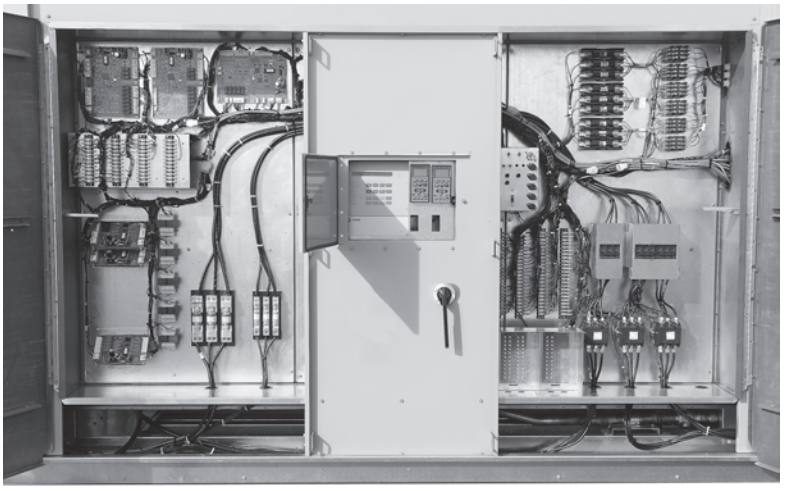
With Rapid Restart and use of a backup generator, the IntelliPak™ Rooftop System can provide full cooling in 120 seconds or less after regaining electrical power. This option is fully integrated into the IntelliPak controls logic via standard human interface. Rapid Restart is a perfect fit in time-sensitive applications where extended down time is not an option and heating/cooling is crucial.

Figure 18. Rapid Restart



Controls

Figure 19. IntelliPak 2 control panel



Variable Air Volume (VAV) Only

Note: *When noted in this sequence "Human Interface Panel," the reference is to both the unit mounted and remote mounted Human Interface Panel. All setpoint adjustments can be accomplished at the unit or Remote Human Interface Panel.*

Supply Air Pressure Control

Variable Frequency Drive (VFD) Control

Variable frequency drives are driven by a modulating 0-10 VDC signal from the Rooftop Module (RTM). A pressure transducer measures duct static pressure, and the VFD is modulated to maintain the supply air static pressure within an adjustable user-defined range. The range is determined by the supply air pressure setpoint and supply air pressure deadband, which are set through the Human Interface Panel or BAS/Network.

Variable frequency drives provide supply fan motor speed modulation. The drive will accelerate or decelerate as required to maintain the supply static pressure setpoint. When subjected to high ambient return conditions the VFD will reduce its output frequency to maintain operation. Bypass control is offered to provide full nominal airflow in the event of drive failure.

Supply Air Static Pressure Limit

The opening of VAV terminals, and the amount of supply air provided by the variable frequency drive are coordinated during start up and transition to/from Occupied/Unoccupied modes to prevent over pressurization of the supply air ductwork. However, if for any reason the supply air pressure exceeds the user-defined supply air static pressure limit that was set at the Human Interface Panel, the supply fan and VFD are shut down. The unit is then allowed to restart three times. If the over pressurization condition occurs on the third time, the unit is shut down and a manual reset diagnostic is set and displayed at the Human Interface Panel and BAS/Network.

Supply Air Temperature Controls

Cooling/Economizer

During Occupied cooling mode of operation, the economizer (if available) and mechanical cooling are used to control the supply air temperature. The supply air temperature setpoint and deadband are user-defined at the Human Interface Panel. The supply air temperature setpoint may be user-defined from the BAS/Network. If the conditions of the outside air are appropriate to use "free cooling," the economizer will first be used in an attempt to satisfy the supply air

setpoint; then, if required, the mechanical cooling will be staged on to maintain supply air temperature setpoint. Minimum On/Off timing of the mechanical cooling prevents rapid cycling.

On units with economizer, a call for cooling will modulate the outside air dampers open. The rate of economizer modulation is based on deviation of the supply air temperature from setpoint, i.e., the further away from setpoint, the faster the outside air damper will open. First stage of cooling will be allowed to start after the economizer reaches full open.

The economizer is only allowed to function freely if one of the following conditions is met:

- For dry bulb economizer control the ambient temperature must be below the dry bulb temperature control setting.
- For reference enthalpy economizer control, outdoor air enthalpy must be below the enthalpy control setting. At outdoor air conditions above the enthalpy control setting, mechanical cooling only is used and the outside air dampers remain at minimum position.
- For comparative enthalpy economizer control, outdoor air enthalpy must be below the enthalpy of the return air.

If the unit does not include an economizer, mechanical cooling only is used to satisfy cooling requirements. The outdoor air dampers may be set for a maximum of 25% outdoor air, through the unit mounted Human Interface Panel or a signal from the BAS/network, if the rooftop is equipped with 0 to 25% motorized outside air dampers.

Heating

Modulating Gas

Upon a call for heating, the HEAT module closes the heating contacts, beginning the firing sequence. First, the heat exchanger combustion blower begins operation. Upon positive proving of combustion airflow, a 60 second pre-purge cycle is executed. Then the ignition sequence takes place.

If ignition is not proven, the safety control locks out and must be manually reset. As long as there is a call for heat, the safety control can be reset, which starts another purge cycle and try for ignition.

Once ignited, as additional heat is required, the combustion air damper opens, increasing the firing rate.

During heating operation, an electronic flame safety control provides continuous flame supervision. If combustion should become unstable for any reason, heating will automatically shut down and be locked out until reset at the unit mounted Human Interface panel.

As the heating requirement is satisfied, the HEAT module will modulate the combustion air damper closed and the firing rate will lower to maintain the desired outlet temperature. When the requirement is fully satisfied, the heating contacts are opened, de-energizing the heat. The specific sequence of operation of the gas heat will depend on the size of the heat exchanger.

Electric Heating

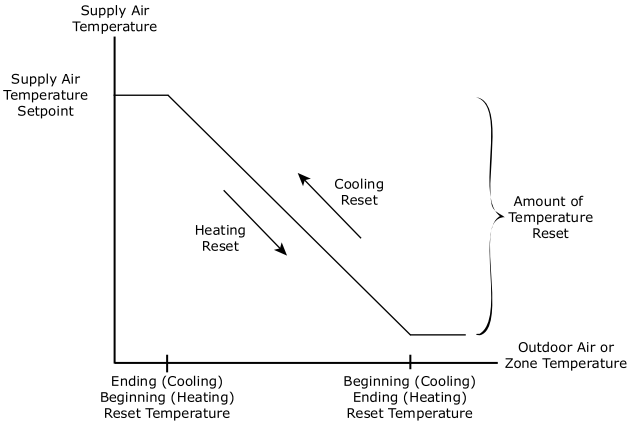
The individual stages of electric heat will be sequenced on the zone demand. The number of available stages will depend on the unit size and heat capacity selected.

Hot Water or Steam

On units with hot water or steam heating, the supply air temperature can be controlled to a heating setpoint during the Occupied mode. The supply air temperature heating setpoint and deadband are user-defined at the Human Interface Panel. VAV Occupied heating on hot water and steam heat units is enabled by closing a field-supplied switch or On units with hot water or steam heating, the supply air temperature can be controlled to a heating setpoint during the Occupied mode. The supply air temperature heating setpoint and deadband are user-defined at the Human Interface Panel. VAV Occupied heating on hot water and steam heat units is enabled by closing a field-supplied switch or contacts connected to an changeover input on the RTM.

Supply Air Setpoint Reset

Figure 20. Supply air temperature reset



Supply air setpoint reset can be used to adjust the supply air temperature setpoint on the basis of a zone temperature or on outdoor air temperature. Supply air setpoint reset adjustment is available from the Human Interface Panel for supply air heating and supply air cooling control.

Outdoor air cooling reset

Outdoor air cooling reset is sometimes used in applications where the outdoor temperature has a large effect on building load. When the outside air temperature is low and the building cooling load is low, the supply air setpoint can be raised, thereby preventing subcooling of critical zones. This reset can lower usage of mechanical cooling, thus savings in compressor kW, but an increase in supply fan kW may occur.

Outdoor air heating reset

Outdoor air heating reset is the inverse of cooling, with the same principles applied.

For both outdoor air cooling reset and heating reset, there are three user-defined parameters that are adjustable through the Human Interface Panel:

- Beginning reset temperature
- Ending reset temperature
- Amount of temperature reset

Zone reset

Zone reset is applied to the zone(s) in a building that tend to over cool or overheat. The supply air temperature setpoint is adjusted based on the temperature of the critical zone(s). This can have the effect of improving comfort and/or lowering energy usage. The user-defined parameters are the same as for outdoor air reset.

Supply Air Tempering

Modulating gas, electric, hot water and steam heat units only—when supply air temperature falls below the supply air temperature deadband low end, the heat valve is modulated open to maintain the set minimum supply air temperature.

Zone Temperature Control

Unoccupied Zone Heating and Cooling

During Unoccupied mode, the unit is operated as a CV unit. VFDs operate at 100% and VAV boxes are driven full open. The unit controls zone temperature within the Unoccupied zone cooling and heating (heating units only) setpoints.

Daytime Warm-up

This feature is available on all types of heating units. During Occupied mode, if the zone temperature falls to a preset, user-defined zone low limit temperature setpoint, the unit is put into Unoccupied mode and Daytime Warm-up is initiated. The system changes over to CV

heating (full unit airflow), the VAV boxes are fully opened and full heating capacity is provided until the Daytime Warm-up setpoint is reached. The unit is then returned to normal Occupied mode.

Outside Air Measurement

Trane air quality (Traq™) outside air measurement damper system utilizes velocity pressure sensing rings. Based on unit design CFM, the ventilation control module (VCM) monitors and controls the quantity of outside air entering the unit. The outside airflow can be calibrated to accommodate for altitude. The following options are also available:

- An optional temperature sensor may be connected to the ventilation control module to enable it to control a field-installed pre-heater.
- An optional CO_2 sensor may be connected to the ventilation control module to control outside air based on CO_2 Demand Control Ventilation (DCV).

Unit Feedback: Supply and Exhaust Fan Speed Setpoints

Controls_VAV_Unit Feedback Setpoints

BACnet® control network (BCI-I) points are available to allow for communication of the Supply and Exhaust Fan Speed Setpoints to the BAS. These points are only available for True VAV units. These setpoints will be overridden by equipment protection functionality, when applicable. These point additions eliminate the need to hard-wire directly to the VFD's for control.

Outside Air CFM Compensation

As the supply fan modulates, this function proportionally adjusts the economizer minimum position to compensate for the change in total airflow, in order to maintain a constant percent of outside air. The modified economizer minimum position is computed as a linear function, based on VFD position, given the two endpoints:

- Minimum Position with VFD @ 0%
- Minimum Position with VFD @ 100%

Both are user adjustable at the Human Interface Panel.

Single Zone Variable Air Volume (SZVAV) Only

The IntelliPak controls platform will support Single Zone VAV as an optional unit control type in order to meet ASHRAE 90.1. The basic control will be a hybrid VAV/CV configured unit that provides discharge temperature control to a varying discharge air temperature target setpoint based on the space temperature and/or humidity conditions. Concurrently, the unit will control and optimize the supply fan speed to maintain the zone temperature to a zone temperature setpoint.

VFD Control

Single Zone VAV units will be equipped with a VFD-controlled supply fan which will be controlled via a 0-10 VDC signal from the Rooftop Module (RTM). With the RTM supply fan output energized and the RTM VFD output at 0 VDC, the fan speed output is 37% (22Hz) from the VFD by default; and at 10 VDC the fan speed output is 100% (60Hz). The control scales the 0-10 VDC VFD output from the RTM linearly to control between the 37-100% range. The VFD will modulate the supply fan motor speed, accelerating or decelerating as required to maintain the zone temperature to the zone temperature setpoint. When subjected to high ambient return conditions the VFD will reduce its output frequency to maintain operation. Bypass control is offered to provide full nominal airflow in the event of drive failure.

Supply Fan Output Control

Units configured for Single Zone VAV control will utilize the same supply fan output control scheme as on traditional VAV units except the VFD signal will be based on zone heating and cooling demand instead of the supply air pressure.

Ventilation Control

Units configured for Single Zone VAV control will require special handling of the OA Damper Minimum Position control in order to compensate for the non-linearity of airflow associated with the variable supply fan speed and damper combinations. Units configured for Traq with or without DCV will operate identically to traditional units with no control changes.

Space Pressure Control

For units configured with Space Pressure Control with or without Statitrac, the new schemes implemented for economizer minimum position handling require changes to the existing Space Pressure Control scheme in order to prevent over/under pressurization. The overall scheme will remain very similar to VAV units with Space Pressure Control with the exception of the dynamic Exhaust Enable Setpoint.

For SZVAV an Exhaust Enable Setpoint must be selected during the 100% Fan Speed Command. Once selected, the difference between the Exhaust Enable Setpoint and Design OA Damper Minimum Position at 100% Fan Speed Command will be calculated. The difference calculated will be used as an offset and added to the Active Building Design OA Minimum Position Target in order to calculate the dynamic Exhaust Enable Target, which will be used throughout the Supply Fan Speed/OA Damper Position range.

The Exhaust Enable Target could be above or below the Active Building Design OA Minimum Position Target Setpoint, based on the Active Exhaust Enable Setpoint being set above or below the Building Design Minimum Position at 100% Fan Speed Command. Note that an Exhaust Enable Setpoint of 0% will result in the same effect on Exhaust Fan control as on VAV applications with and without Statitrac.

Occupied Cooling Operation

For normal cooling operation, cooling capacity will be staged or modulated in order to meet the calculated discharge air target setpoint. If the current active cooling capacity is controlling the discharge air within the deadband, no additional cooling capacity change will be requested. As the Discharge Air Temperature rises above the deadband, the algorithm will request additional capacity as required (additional compressors or economizer). As the Discharge Air Temperature falls below the deadband, the algorithm will request a reduction in active capacity.

Default Economizer Operation

By default, the unit will be setup to optimize the minimum supply fan speed capability during Economizer Only operation. If the economizer is able to meet the demand alone, due to desirable ambient conditions, the supply fan speed will be allowed to increase above the minimum prior to utilizing mechanical cooling if discharge air setpoint falls below the discharge air Lower Limit (Cooling) setpoint.

Unoccupied Mode

In Unoccupied periods the unit will utilize setback setpoints, 0% Minimum OA Damper position, and Auto Fan Mode operation as on normal Constant Volume units. The Supply Fan speed will be forced to 100% for all active heating and cooling requests in this mode.

Occupied Heating Operation

Occupied heating operation will utilize two separate control methodologies based on heating configurations. For all “Staged” Heating types, the unit will utilize full airflow during all active heating periods exactly like traditional Constant Volume units. For “Modulating” Heating types the unit will have the ability to utilize SZVAV Heating, much like Active Cooling, in order to maintain the Zone Temperature to the Zone Heating setpoint. Also, on units configured with a Modulating Heat type, the customer will have the ability to select between the new SZVAV Heating control, or to utilize traditional Constant Volume, full airflow heating based on the associated unit setup.

Compressor (DX) Cooling

Compressor control and protection schemes will function identical to that of a traditional unit. Normal compressor proving and disable input monitoring will remain in effect as well as normal three minute minimum on, off, and inter-stage timers. Also, all existing head pressure control schemes will be in effect.

Cooling Sequence

If the control determines that there is a need for compressor stages in order to meet the calculated discharge air target setpoint, once supply fan proving has been made, the unit will begin to stage compressors accordingly.

Note: *The compressor staging order will be based on unit configuration and compressor lead/lag status.*

Once the discharge air target setpoint calculation has reached the user define Minimum Setpoint and compressors are being utilized to meet the demand, if the cooling demand increases, the discharge air target setpoint value will continue to lower past the minimum setpoint and begin to ramp the supply fan speed upward toward 100%.

Once the discharge air target setpoint calculation has reached the Minimum Setpoint and compressors are being utilized to meet the demand, as the discharge air target setpoint value continues to calculate lower the algorithm will begin to ramp the supply fan speed up toward 100%. Note that the supply fan speed will remain at the compressor stage's associated minimum value (as described below) until the discharge air target setpoint value is calculated below the discharge air temperature Minimum Setpoint (limited discharge air target setpoint).

As the cooling load in the zone decreases the zone cooling algorithm will reduce the speed of the fan down to minimum per compressor stage and control the compressors accordingly. As the compressors begin to de-energize, the supply fan speed will fall back to the Cooling Stage's associated minimum fan speed, but not below. As the load in the zone continues to drop, cooling capacity will be reduced in order to maintain the discharge air within the ±½ discharge air target deadband.

Constant Volume (CV) Only

Occupied Zone Temperature Control

Cooling/Economizer

During Occupied cooling mode, the economizer (if provided) and mechanical cooling are used to control zone temperature. The zone temperature cooling setpoint is user-defined at the Human Interface Panel or from the BAS/Network. If the conditions of outside air is appropriate to use "free cooling", the economizer will be first be used to attempt to satisfy the cooling zone temperature setpoint; then the compressors will be staged up as necessary. Minimum on/off timing of compressors prevents rapid cycling.

On units with economizer, a call for cooling will modulate the outside air dampers open. The rate of economizer modulation is based on deviation of the zone temperature from setpoint, i.e., the further away from setpoint, the faster the outside air damper will open. First stage of cooling will be allowed to start after the economizer reaches full open.

The economizer is only allowed to function freely if one of the following conditions is met:

- For dry bulb economizer control, the ambient temperature must be below the dry bulb temperature control setting.
- For reference enthalpy economizer control, outdoor air enthalpy must be below the enthalpy control setting. At outdoor air conditions above the enthalpy control setting, mechanical cooling only is used and the outdoor air dampers remain at minimum position.
- For comparative enthalpy economizer control, outdoor air enthalpy must be below the enthalpy of the return air.

.

If the unit does not include an economizer, mechanical cooling only is used to satisfy cooling requirements. The outdoor air dampers may be set for a maximum of 25% outdoor air, through

the unit mounted Human Interface Panel or a signal from the BAS/network, if the rooftop is equipped with 0 to 25% motorized outside air dampers.

Heating

Gas Heating: Two-Stage

Upon a call for heating, the HEAT module closes the first stage heating contacts beginning the firing sequence. First, the heat exchanger combustion blower begins operation. Upon positive proving of combustion airflow, a 60 second pre-purge cycle is executed. Then the ignition sequence takes place.

If ignition is not proven, the safety control locks out and must be manually reset. As long as there is a call for heat, the safety control can be reset, which starts another purge cycle and try for ignition. As additional heat is required, the HEAT module will close the second stage heating contacts and depending on heat module size, will open either the second stage of the gas valve, or a second stage gas valve.

During heating operation, an electronic flame safety control provides continuous flame supervision. If combustion should become unstable for any reason, heating will automatically shut down. On the low heat for all unit sizes and the medium heat for the 90 and 105 ton, after a one minute delay, plus another 60 second pre-purge cycle the ignition cycle begins. On all other heat sizes the heating section will be shutdown and locked out after the first shutdown due to flame instability, until manually reset at the ignition module and at the unit-mounted Human Interface Panel .

As the heating requirement is satisfied, the HEAT module will open the second stage heating relay, de-energizing the second stage of heat. When the requirement is fully satisfied, the first stage contacts are opened, de-energizing the first stage of heat.

Gas Heating: Modulating Gas

Upon a call for heating, the HEAT module closes the heating contacts, beginning the firing sequence. First, the heat exchanger combustion blower begins operation. Upon positive proving of combustion airflow, a pre-purge cycle is executed. Then the ignition sequence takes place.

If ignition is not proven, the safety control locks out and must be manually reset. As long as there is a call for heat, the safety control can be reset, which starts another purge cycle and try for ignition.

Once ignited, as additional heat is required, the combustion air damper opens, increasing the firing rate. During heating operation, an electronic flame safety control provides continuous flame supervision. If combustion should become unstable for any reason, heating will automatically shut down and be blocked out until reset at the unit-mounted Human Interface panel.

As the heating requirement is satisfied, the HEAT module will modulate the combustion air damper closed, and the firing rate will lower to maintain the desired outlet temperature. When the requirement is fully satisfied, the heating contacts are opened, de-energizing the heat. The specific sequence of operation of the gas heat will depend on the size of the heat exchanger.

Electric Heating

The individual stages of electric heat will be sequenced on the zone demand signal from the zone sensor. The signal is sent to the UCM and the stages are sequenced based on load demand. The number of available stages will depend on the unit size and heat capacity selected.

Hot Water or Steam Heating

Upon a call for heat, the UCM will send a varying voltage signal to the valve actuator. The valve will modulate to meet building demand as indicated by the voltage signal. When heating is satisfied, the valve will modulate closed. A temperature sensor is located on the coldest section of the coil. When it senses an impending freeze condition, a signal is sent to the hydronic valve to drive it full open. If the supply fan is on, or if the outside air damper is open when this freezing condition is sensed, the supply fan is turned off and the outside air damper is closed.

Supply Air Tempering

For staged gas and electric heat units in the occupied Heating mode, but not actively heating, if the supply air temperature drops to 10°F below the Occupied zone heating temperature setpoint, one stage of heat will be brought on to maintain a minimum supply air temperature. The heat stage is turned off if the supply air temperature rises to 10°F above the Occupied zone heating temperature setpoint. On units with hot water or steam heating, if the supply air temperature drops below 48°F, the heating valve is modulated to maintain 50°F supply air temperature with a 4°F deadband.

Auto Changeover

When the System Mode is "Auto," the mode will change to cooling or heating as necessary to satisfy the zone cooling and heating setpoints. The zone cooling and heating setpoints can be as close as 2°F apart.

Unoccupied Zone Temperature Control

Cooling and Heating

Cooling and/or heating modes can be selected to maintain Unoccupied zone temperature setpoints. For Unoccupied periods, heating, economizer operation or compressor operation can be selectively locked out at the Human Interface Panels.

CV, SZVAV, and VAV

Note: *SZVAV exceptions are noted in parenthesis.*

Space Pressure Control - Statitrac

A pressure transducer is used to measure and report direct space (building) static pressure. The user-defined control parameters used in this control scheme are space static pressure setpoint, space pressure deadband and exhaust enable point. As the economizer opens, the building pressure rises and once above the exhaust enable point, enables the exhaust fan and dampers or exhaust VFD. The exhaust dampers or VFD then modulate to maintain space pressure within the deadband.

Morning Warm-up Options (Not applicable to SZVAV)

This feature may be enabled on all types of factory installed heat units as well as cooling only units configured as "External Heat" (for example, VAV boxes with reheat). At the conclusion of Unoccupied mode, while the economizer (if supplied) is kept closed, the selected zone is heated to the user-defined Morning Warm-up setpoint. The unit is then released to Occupied mode. There are two types of Morning Warm-up: full capacity or cycling capacity:

Full Capacity Morning Warm-up (MWU)

Full capacity Morning Warm-up uses full heating capacity, and heats the zone up as quickly as possible. Full heating capacity is provided until the Morning Warm-up setpoint is met. At this point, the unit is released to occupied mode.

Cycling Capacity Morning Warm-up (MWU)

Cycling capacity Morning Warm-up provides a more gradual heating of the zone. Normal zone temperature control with varying capacity is used to raise the zone temperature to the MWU zone temperature setpoint. This method of warm-up is used to overcome the "building sink" effect. Cycling capacity MWU will operate until the MWU setpoint is reached or for 60 minutes, then the unit switches to Occupied mode. A control algorithm is used to increase or decrease the amount of heat in order to achieve the MWU zone temperature setpoint.

Note: *When using the Morning Warm-up option in a VAV heating/cooling rooftop, airflow must be maintained through the rooftop unit. This can be accomplished by electrically tying the VAV boxes to the VAV box output relay contacts on the Rooftop Module (RTM) or by using changeover thermostats. Either of these methods will assure adequate airflow through the unit and satisfactory heating of the building.*

Emergency Override

When a LonTalk® communication protocol or BACnet® control network is installed, the user can initiate from the Trane Tracer Summit™ building automation system (in the case of LCI), Tracer SC or third party BAS (with either BCI or LCI) one of five predefined, not available to configure, Emergency Override sequences. All compressors, condenser fans and the Humidification output are de-energized for any Emergency Override sequence. Each Emergency Override sequence commands the unit operation as follows:

PRESSURIZE_EMERG:

- Supply Fan - On
- Supply Fan VFD - Max (if so equipped)
- Exhaust Fan - Off; Exhaust Dampers - Closed (if so equipped)
- OA Dampers - Open; Return Damper - Closed
- Heat - All heat stages off; Mod Heat output at 0 VDC
- Occupied/Unoccupied/VAV box output - Energized
- VOM Relay - Energized (if so equipped)
- Preheat Output - Off
- Return Fan - Off; Exhaust Dampers - Closed (if so equipped)
- Return VFD - Min (if so equipped)

EMERG_DEPRESSURIZE:

- Supply Fan - Off
- Supply Fan VFD - Min (if so equipped)
- Exhaust Fan - On; Exhaust Dampers - Open/Max (if so equipped)
- OA Dampers - Closed; Return Damper - Open
- Heat - All heat stages off; Mod Heat output at 0 VDC
- Occupied/Unoccupied/VAV box output - Energized
- VOM Relay - Energized (if so equipped)
- Preheat Output - Off
- Return Fan - On; Exhaust Dampers - Open (if so equipped)
- Return VFD - Max (if so equipped)

EMERG_PURGE:

- Supply Fan - On
- Supply Fan VFD - Max (if so equipped)
- Exhaust Fan - On; Exhaust Dampers Open (if so equipped)
- OA Dampers - Open; Return Damper - Closed
- Heat - All heat stages off; Mod Heat output at 0 VDC
- Occupied/Unoccupied/VAV box output - Energized
- VOM Relay - Energized (if so equipped)
- Preheat Output - Off
- Return Fan - On; Exhaust Dampers - Open (if so equipped)
- Return VFD - Max (if so equipped)

EMERG_SHUTDOWN:

- Supply Fan - Off
- Supply Fan VFD - Min (if so equipped)
- Exhaust Fan - Off; Exhaust Dampers Closed (if so equipped)
- OA Dampers - Closed; Return Damper - Open
- Heat - All heat stages off; Mod Heat output at 0 VDC
- Occupied/Unoccupied/VAV box output - Energized
- VOM Relay - Energized (if so equipped)
- Preheat Output - Off
- Return Fan - Off; Exhaust Dampers - Closed (if so equipped)
- Return VFD - Min (if so equipped)

EMERG_FIRE - Input from fire pull box/system:

- Supply Fan - Off

- Supply Fan VFD - Min (if so equipped)
- Exhaust Fan - Off; Exhaust Dampers Closed (if so equipped)
- OA Dampers - Closed; Return Damper - Open
- Heat - All heat stages off; Mod Heat output at 0 VDC
- Occupied/Unoccupied/VAV box output - Energized
- VOM Relay - Energized (if so equipped)
- Preheat Output - Off
- Return Fan - Off; Exhaust Dampers - Closed (if so equipped)
- Return VFD - Min (if so equipped)

Ventilation Override Module (VOM)

The user can customize up to five different override sequences for purposes of ventilation override control. If more than one VOM sequence is being requested, the sequence with the highest priority is initiated first. Sequence hierarchy is the sequence "A" (UNIT OFF) is first, with sequence "E" (PURGE with Duct Pressure Control) last. A ventilation override mode can be initiated by closing any of the five corresponding binary inputs on the VOM module. A binary output is provided on the VOM module to provide remote indication of an active VOM mode. All compressors, condenser fans and the Humidification output are de-energized for any VOM sequence. The factory default definitions for each mode are as follows:

UNIT OFF sequence "A"

When complete system shutdown is required the following sequence can be used.

- Supply Fan - Off
- Supply Fan VFD - Min (if so equipped)
- Exhaust Fan - Off; Exhaust Dampers - Closed (if so equipped)
- OA Dampers - Closed; Return Damper - Open
- Heat - All heat stages off; Mod Heat output at 0 VDC
- Occupied/Unoccupied/VAV box output - Deenergized
- VOM Relay - Energized
- Preheat Output - Off
- Return Fan - Off; Exhaust Dampers - Closed (if so equipped)
- Return VFD - Min (if so equipped)
- OA Bypass Dampers - Open (if so equipped)
- Exhaust Bypass Dampers - Open (if so equipped)

PRESSURIZE sequence "B"

Perhaps a positively pressurized space is desired instead of a negatively pressurized space. In this case, the supply fan should be turned on with VFD at 100% speed and exhaust fan should be turned off.

- Supply Fan - On
- Supply Fan VFD - Max (if so equipped)
- Exhaust Fan - Off; Exhaust Dampers - Closed (if so equipped)
- OA Dampers - Open; Return Damper - Closed
- Heat - All heat stages off; Mod Heat output at 0 VDC
- Occupied/Unoccupied/VAV box output - Energized
- VOM Relay - Energized
- Preheat Output - Off
- Return Fan - Off; Exhaust Dampers - Closed (if so equipped)
- Return VFD - Min (if so equipped)
- OA Bypass Dampers - Open (if so equipped)
- Exhaust Bypass Dampers - Open (if so equipped)

EXHAUST sequence "C"

With only the exhaust fans running (supply fan off), the space that is conditioned by the rooftop would become negatively pressurized. This is desirable for clearing the area of smoke from the now-extinguished fire, possibly keeping smoke out of areas that were not damaged.

- Supply Fan - Off

- Supply Fan VFD - Min (if so equipped)
- Exhaust Fan - On; Exhaust Dampers Open (if so equipped)
- OA Dampers - Closed; Return Damper - Open
- Heat - All heat stages off; Mod Heat output at 0 VDC
- Occupied/Unoccupied/VAV box output - Deenergized
- VOM Relay - Energized
- Preheat Output - Off
- Return Fan - On; Exhaust Dampers - Open (if so equipped)
- Return VFD - Max (if so equipped)
- OA Bypass Dampers - Open (if so equipped)
- Exhaust Bypass Dampers - Open (if so equipped)

PURGE sequence "D"

Possibly this sequence could be used for purging the air out of a building before coming out of Unoccupied mode of operation on VAV units or for the purging of smoke or stale air if required after a fire.

- Supply Fan - On
- Supply Fan VFD - Max (if so equipped)
- Exhaust Fan - On; Exhaust Dampers Open (if so equipped)
- OA Dampers - Open; Return Damper - Closed
- Heat - All heat stages off; Mod Heat output at 0 VDC
- Occupied/Unoccupied/VAV box output - Energized
- VOM Relay - Energized
- Preheat Output - Off
- Return Fan - On; Exhaust Dampers - Open (if so equipped)
- Return VFD - Max (if so equipped)
- OA Bypass Dampers - Open (if so equipped)
- Exhaust Bypass Dampers - Open (if so equipped)

PURGE with duct pressure control sequence "E"

This sequence can be used when supply air control is required for smoke control.

- Supply Fan - On
- Supply Fan VFD - (If so equipped) Controlled by Supply Air Pressure Control function; Supply Air Pressure High Limit disabled
- Exhaust Fan - On; Exhaust Dampers Open (if so equipped)
- OA Dampers - Open; Return Damper - Closed
- Heat - All heat stages off; Mod Heat output at 0 VDC
- Occupied/Unoccupied/VAV box output - Energized
- VOM Relay - Energized
- Preheat Output - Off
- Return Fan - On; Exhaust Dampers - Open (if so equipped)
- Return VFD - Max (if so equipped)
- OA Bypass Dampers - Open (if so equipped)
- Exhaust Bypass Dampers - Open (if so equipped)

To use a RHI the unit must be equipped with an optional Inter-Processor Communications Bridge (IPCB) module. The RHI can be located up to 1,000 feet from the unit. A single RHI can be used to monitor and control up to four (4) rooftops, each containing an IPCB.

Human Interface Panel (HI)

The Human Interface (HI) Panel provides a 2 line X 40 character clear English liquid crystal display and a 16 button keypad for monitoring, setting, editing and controlling. The Human Interface Panel is mounted in the unit's main control panel and is accessible through an independent door.

The optional remote mount version of the Human Interface (RHI) Panel has all the functions of the unit mount version except Service Mode.

Human Interface Panel Main Menu

- **STATUS** — used to monitor all temperatures, pressures, humidities, setpoints, input and output status.
- **CUSTOM** — allows the user to create a custom status menu consisting of up to four (4) screens of the data available in the Status menu.
- **SETPOINTS** — used to review and/or modify all the factory preset Default setpoints and setpoint source selections.
- **DIAGNOSTICS** — used to review active and historical lists of diagnostic conditions. More than 100 different diagnostics can be read at the Human Interface Panel. The last 20 unique diagnostics can be held in an active history buffer log.
- **SETUP** — Control parameters, sensor source selections, function enable/disable, output definitions, and numerous other points can be edited in this menu. All points have factory preset values so unnecessary editing is kept to a minimum.
- **CONFIGURATION** — Preset with the proper configuration for the unit as it ships from the factory, this information would be edited only if certain features were physically added or deleted from the unit. For example, if a field supplied Ventilation Override Module was added to the unit in the field, the unit configuration would need to be edited to reflect that feature.
- **SERVICE** — used to selectively control outputs (for compressors, fans, damper position, etc.) for servicing or troubleshooting the unit. This menu is accessible only at the unit mounted Human Interface Panel.

Demand Limit (Not applicable to SZVAV)

This mode is used to reduce electrical consumption at peak load times. When demand limiting is needed, mechanical cooling and/or heating operation are either partially or completely disabled in order to save energy.

The definition of Demand Limit is user-definable at the Human Interface Panel. Demand Limit mode is initiated via a field supplied switch or contact closure (GBAS 0-5 VDC module or GBAS 0-10 VDC module) or via a communicated request (LCI or BCI). When the request for demand limit has been cancelled, the unit cooling and/or heating functions will become fully enabled.

Generic Building Automation System Module (GBAS 0-5 / 0-10 VDC)

The Generic Building Automation System Module (GBAS) is used to provide broad control capabilities for building automation systems other than the Trane Tracer Summit™ building automation system. The modules differ on the input signal and the number of binary I/O.

The following inputs and outputs are provided:

Analog Inputs — Four analog inputs, controlled via a field provided potentiometer or a VDC signal.

Table 1. Analog inputs (0-5 VDC, 0-10 VDC)

Set Point	System Control
Occupied Zone Cooling Setpoint	CV & SZVAV
Unoccupied Zone Cooling Setpoint	ALL
Occupied Zone Heating Setpoint	CV & SZVAV
Unoccupied Zone Heating Setpoint	ALL
Supply Air Cooling Setpoint	CV, SZVAV, VAV[a]
Supply Air Heating Setpoint	CV, SZVAV, VAV[a]
Space Static Pressure Setpoint	ALL
Supply Air Static Pressure Setpoint	VAV
Minimum Outside Air Flow Setpoint	ALL

Table 1. Analog inputs (0-5 VDC, 0-10 VDC) (continued)

Set Point	System Control
Morning Warm Up Setpoint	CV & VAV
Economizer Dry Bulb Enable Setpoint	ALL
Minimum Outside Air Position Setpoint	ALL
Occupied Humidification Setpoint	ALL
Unoccupied Humidification Setpoint	ALL
Occupied Dehumidification Setpoint	ALL
Unoccupied Dehumidification Setpoint	ALL

(a) With discharge temperature control only

Analog Outputs — Four analog outputs that can be configured to be any of the following:

Table 2. Analog outputs (0-10 VDC only)

Ouput	System Control
Outdoor Air Temperature	ALL
Zone Temperature	ALL
Supply Air Temperature	CV, SZVAV, VAV(a)
Supply Air Pressure	SZVAV & VAV
Space Pressure	ALL
Space Relative Humidity	ALL
Outdoor Air Relative Humidity	ALL
Space CO2 Level	ALL
Compressor Staging (%)	ALL
Heat Staging (%)	ALL
Outdoor Air Damper Position	ALL
Outdoor Airflow	ALL
Occupied Humidification Setpoint	ALL
Unoccupied Humidification Setpoint	ALL

(a) With discharge temperature control only

Binary Outputs — each of the five relay outputs can be mapped to any/all of the available diagnostics.

Binary Input — the single binary input can initiate or terminate the Demand Limit mode of operation via a field supplied switch or contact closure.

Frost Avoidance

Evaporator Coil Frost Protection - Frostat™

A temperature sensor on each evaporator circuit is used to determine if the coil is getting close to a freezing condition. Mechanical cooling capacity is shed as necessary to prevent icing. The Frostat™ system eliminates the need for hot gas bypass and adds a suction line surface temperature sensor near the TXV bulb location to shed cooling when coil frosting conditions occur. The supply fans are not shut off and will de-ice the coil. Timers prevent the compressors from rapid cycling.

Steam and Hot Water Coil - Freeze Avoidance

Freeze Avoidance is a feature which helps prevent freezing of steam or hot water heat coils during periods of unit inactivity and low ambient temperatures. Whenever the unit supply fan is off, the outdoor air temperature is monitored. If the temperature falls below a predetermined value, the heating valve is opened to a position selected at the unit mounted Human Interface to allow a minimum amount of steam or hot water to flow through the coil and avoid freezing conditions.

Occupied/Unoccupied Switching

There are three ways to switch Occupied/Unoccupied:

- Night Setback (NSB) Panel
- Field-supplied contact closure (hard wired binary input to RTM) (CV, SZVAV and VAV)
- Tracer (or third party BAS with LCI or BCI module)

Night Setback Sensors

The Trane night setback sensors are programmable with a time clock function that provides communication to the rooftop unit through a two-wire communications link. The desired transition times are programmed at the night setback sensor and communicated to the rooftop.

Night setback (unoccupied mode) is operated through the time clock provided in the sensors with night setback. When the time clock switches to night setback operation, the outdoor air dampers close and heating/cooling can be enabled or disabled depending on setup parameters. As the building load changes, the night setback sensor energizes the rooftop heating/cooling (if enabled) function and the evaporator fan. The rooftop unit will cycle through the evening as heating/cooling (if enabled) is required in the space. When the time clock switches from night setback to occupied mode, all heating/cooling functions begin normal operation.

When using the night setback options with a VAV heating/cooling rooftop, airflow must be maintained through the rooftop unit. This can be accomplished by electrically tying the VAV boxes to the VAV Box output relay contacts on the Rooftop Module (RTM) or by using changeover thermostats. Either of these methods will assure adequate airflow through the unit and satisfactory temperature control of the building.

Occupied/Unoccupied Input on the RTM

This input accepts a field supplied switch or contacts closure such as a time clock.

Trane Tracer Summit™ or BAS System

The Trane Tracer Summit™ building management system or a third party BAS (with LCI or BCI module) can control the Occupied/Unoccupied status of the rooftop.

Timed Override Activation - ICS

This function is operational when the RTM is selected as the Zone Temperature Sensor source at the Human Interface Panel. When this function is initiated by the push of a override button on the ICS sensor, the Tracer will switch the unit to the Occupied mode. Unit operation (Occupied mode) during timed override is terminated by a signal from Tracer.

Timed Override Activation - Non-ICS

This function is active whenever the RTM is selected as the Zone Temperature Sensor source at the Human Interface Panel. When this function is initiated by the push of an override button on the zone sensor, the unit will switch to the Occupied mode. Automatic Cancellation of the Timed Override Mode occurs after three hours of operation.

Economizer Controls

Comparative Enthalpy Control of Economizer

An optional comparative enthalpy system is used to control the operation of the economizer, and measures the temperature and humidity of both return air and outside air to determine which

source has lower enthalpy. This system allows true comparison of outdoor air and return air enthalpy by measurement of outdoor air and return air temperatures and humidities.

Reference Enthalpy Control of Economizer

The optional reference enthalpy compares outdoor air temperature and humidity to the economizer enthalpy control setpoint. If outdoor air temperature and humidity are below the economizer enthalpy control setpoint, the economizer will operate freely.

This system provides more sophisticated control where outdoor air humidity levels may not be acceptable for building comfort and indoor air quality.

Dry Bulb Temperature Control of Economizer

The optional dry bulb system measures outdoor temperature comparing it to the economizer control temperature setpoint. If the outdoor temperature is below the economizer dry bulb temperature control setpoint, the economizer will operate freely. This system is best suited for arid regions where the humidity levels of outside air would not be detrimental to building comfort and indoor air quality.

Refrigeration Circuit Lead/Lag

Refrigeration Circuit lead/lag is a user-selectable feature through the Human Interface Panel available on all units without the eFlex™ variable speed option. After each request for compressor operation, the lead refrigeration circuit switches, thereby causing a more equitable or balanced run time among compressors.

Emergency Stop Input

A binary input is provided on the Rooftop Module (RTM) for installation of field provided switch or contacts for immediate shutdown of all unit functions.

Anti-Short Recycle Protection

A standard feature provided to prevent excessive cycling and premature wear of the compressors, contactors and related components.

High Duct Temperature Sensor

Two manual reset, high temperature limit thermostats are provided. One is located in the discharge section of the unit set at 240°F and the other in the return air section of the unit set at 135°F. If either setpoint is reached, the rooftop unit is shut down.

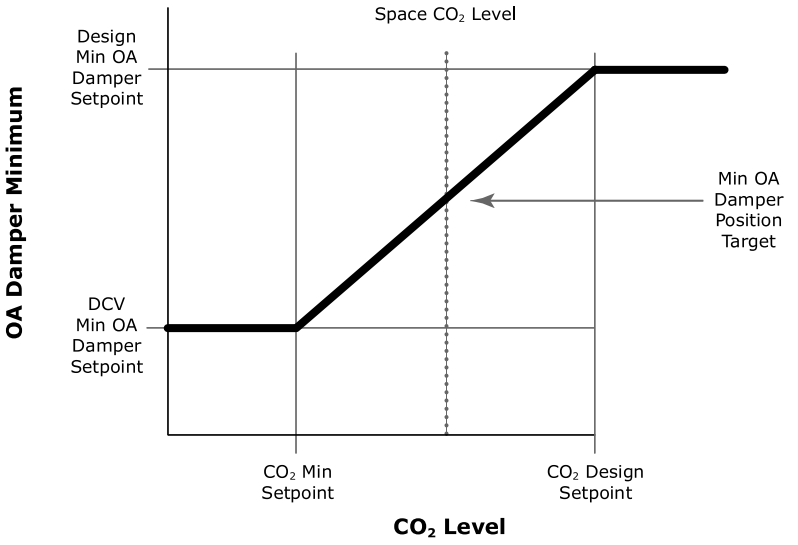
CO_2 Control - Demand Control Ventilation (DCV)

A ventilation reset function that provides the necessary ventilation for occupants and reduces energy consumption by minimizing the outdoor air damper position (or the OA flow setpoint with Traq) below the Building Design Minimum, while still meeting the ASHRAE Std 62.1-2004 ventilation requirements.

- If the space CO_2 level is greater than or equal to the CO_2 Design Setpoint, the outdoor air damper will open to the Design Min Outdoor Air Damper (or OA Flow) Setpoint. If there is a call for economizer cooling, the outdoor air damper may be opened further to satisfy the cooling request.
- If the space CO_2 level is less than or equal to the CO_2 Minimum Setpoint, the outdoor air damper will close to the DCV Minimum Outdoor Air Damper (or OA Flow) Setpoint. If there is a call for economizer cooling, the outdoor air damper may be opened further to satisfy the cooling request.
- If the space CO_2 level is greater than the CO_2 Minimum Setpoint and less than the CO_2 Design Setpoint, the outdoor air damper position is (or OA flow) modulated proportionally to the Space CO_2 level relative to a point between the CO_2 Min Setpoint and the CO_2 Design Setpoint. If there is a call for economizer cooling, the outdoor air damper may be opened further to satisfy the cooling request.

Note: *CO_2 sensor used with Demand Control Ventilation must be powered from an external power source or separate 24 VAC transformer.*

Figure 21. CO_2 control



Humidification Control

A relay output is provided to control an externally connected, field supplied humidifier. Logic is provided for Occupied and Unoccupied humidification control with safeguards to prevent cycling between humidification and dehumidification

Return Fan Control

A return fan reduces the load on the supply fan motor or can allow a unit to operate at a higher static pressure. The return fan VFD is modulated independently to maintain desired return air plenum pressure. In all other cases the return fan is turned on or off with the supply fan.

Low Charge Protection

The low charge feature measures the entering and leaving evaporator temperatures on each circuit to calculate a superheat value for each circuit. The superheat value is used for multiple purposes:

- Displayed at the Human Interface panel to assist the service technician with unit charging and diagnostics
- A diagnostic message displayed at the Human Interface panel, warning of a low charge situation when the unit is just slightly undercharged. The unit will be allowed to run.
- A diagnostic message displayed at the Human Interface panel, warning of a low charge situation when the unit is undercharged. The undercharged circuit will be locked out to protect the compressors.

Condenser Fan Cycling

The IntelliPak 2 controller cycles condenser fans based on ambient temperature and saturated condensing temperature to ensure the optimum operating conditions for the unit.

LonTalk® Building Automation System

The LonTalk® communication protocol for the IntelliPak (LCI-I) controller expands communications from the unit UCM network to a Trane Tracer Summit™ building automation system or third party building automation system. Utilizing LonTalk®, the BAS allows external setpoint and configuration adjustment and monitoring of status and diagnostics. The LCI-I utilizes an FTT-10A free topology transceiver, which supports non-polarity sensitive, free topology wiring—which in turn allows the system installer to utilize star, bus, and loop architectures. This controller works in standalone mode, peer-to-peer with one or more other

units, or when connected to a Tracer Summit™ or a third party building automation system that supports LonTalk®. The LCI-I controller is available as a factory or field-installed kit.

BACnet® Building Automation Control Network

The BACnet® control network for IntelliPak (BCI-I) expands communications from the unit UCM network to the Trane Tracer Summit™ building automation system or third party building automation system. Utilizing BACnet®, the BAS allows external setpoint and configuration adjustment and monitoring of status and diagnostics. The BCI-I utilizes the BACnet® defined MS/TP protocol as defined in ASHRAE standard 135-2004. This controller works in standalone mode, with Tracer Summit™ or when connected to a third party building automation system that supports BACnet®. The BCI-I controller is available as a factory or field-installed kit.

AirFi™ Wireless Communication Interface

Trane AirFi™ Wireless Comm replaces the BACnet communication link and sensor wire on Tracer® building automation systems for faster, easier, lower-risk installation and life-cycle savings.

Twinning

Twinning is a master unit and one or more similarly configured slave unit(s) operating cooperatively, to provide higher capacity and/or redundancy at partial capacity.

Twinning requires an LCI module be installed in each unit and is accomplished by binding variables between unit communication modules, communicating common setpoints and conditions (temperatures, pressures, fan speeds, damper positions, occupancy, states, etc.), and allowing each unit to run independent algorithms.

Note: *BCI-I does not have twinning capabilities.*

Twinned units must share a common supply and return duct network. Twinned units operate:

- as part of a Trane Integrated Comfort System installation, with Tracer Summit.
- on an inter-operable project with a third party LonTalk.
- as an independent group (bound via Rover or third party tool).

Energy Recovery Wheel

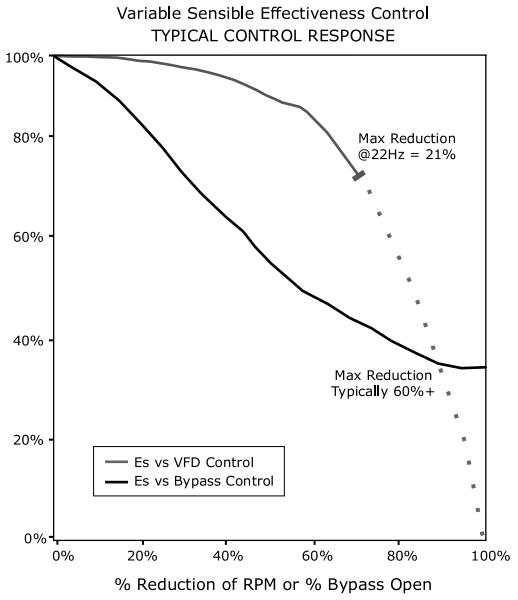
Variable effectiveness is a means to control the capacity of an energy wheel. Normal wheel sizing is for worst case winter/summer load; therefore, at part load the wheel may be oversized and variable effectiveness is justifiable. Variable effectiveness control can be used in any application where the outdoor air temperature may fall between the discharge air setpoint and the temperature at which heating is required.

For example, a job may have a required supply air set point of 55°F. A typical return air temperature may be 70°F and the outside air temperature 40°F. The energy wheel could heat the supply air to over 60°F, but by employing variable effectiveness, the energy wheel capacity can be modulated to exactly match the required supply air temperature without using additional heating or cooling. Therefore, variable effectiveness control can significantly add to the amount of energy saved in a year.

Variable effectiveness can be accomplished by varying the wheel rotational speed or by bypassing a portion of the exhaust air around the wheel matrix. IntelliPak 2 utilizes an exhaust air bypass damper for capacity control.

When unit mode and psychrometric conditions allow, the energy recovery wheel will turn "ON". The wheel uses energy from the return air stream to temper the outside air stream, thereby reducing the load of the space without utilizing mechanical cooling and heating.

Figure 22. Variable sensible effectiveness control



Modulating Hot Gas Reheat

When space conditions allow, the modulating hot gas reheat function activates the reheat mode. The reheat valve and cooling valve are modulated to control the discharge air temperature to the discharge air temperature reheat setpoint (default 70 °F).

In reheat mode, the reheat valve is commanded (15 to 85%) to control to the discharge air reheat setpoint and the cooling valve mirrors the reheat valve position (85 to 15%).

Low Ambient Function

The low ambient function is a head pressure control scheme that allows compressor operation at a lower ambient temperature, without tripping the low pressure cutout switch (LPC). For this function, normal condenser fan staging applies. The first condenser fan on each circuit is modulated by a variable frequency drive (VFD). The fan speed is modulated to control to the saturated condenser temperature control Setpoint.

Low Ambient Compressor Lockout

This function will lock out the compressor if the outdoor air temperature is below the low ambient compressor lock out temperature setpoint. The factory setpoint is 50°F on standard units and 0°F on low ambient units. This setpoint is adjustable at the Human Interface Panel. Compressors will be locked out when outdoor air temperatures fall below the selected temperature and will be allowed to start again when temperatures rise 5°F above the setpoint.

Evaporative Condenser

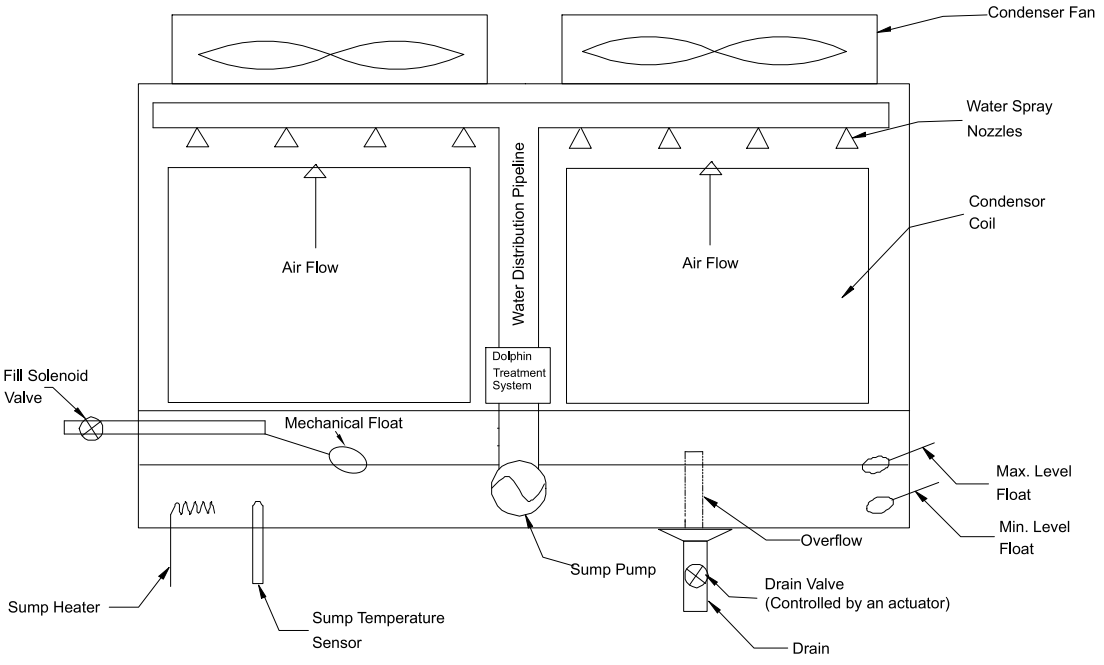
The evaporative condenser function is a method of head pressure control that utilizes water as the condensing medium rather than air. This method of head pressure control provides increased unit efficiency.

The function activates whenever a compressor is active on a circuit and modulates the condenser fan speed to control the Saturated Condenser Temperature (SCT) Control Setpoint. If the saturated condenser temperature continues to rise above the SCT upper limit, the sump pump will be energized.

Once the temperature falls below the SCT lower limit, the sump pump will be de-energized.

The function has a sump water freeze protection, a periodic partial water flush to reduce contaminant build up, an external drain request, and a water treatment option.

Figure 23. Evaporative condenser flow schematic



Rapid Restart (RR) Only

The IntelliPak™ controls platform will support rapid restart unit startup after every power cycle occurs. There will be no assumptions about how long the unit has been OFF, so the unit will perform the same startup sequence with each occurrence.

The following is a list of the control operations:

- This is a cooling only function and will not function with heating.
- RR will target a four-minute maximum time from start signal to 100% cooling with an upper limit of five minutes.
- Outside air temperatures relative to the Low Ambient Lockout Setpoint will determine whether economizer cooling or DX staging will be the primary source for cooling.
- The use of economizing below low ambient lockout (typically 50°F) during the RR function will be a selectable option on the HI.
- Until the RR termination conditions are met, the unit will ramp the outside air damper open, if under economizer operation. Until the RR termination conditions are met, the unit will stage DX mechanical cooling, if available, at six second intervals.
- Supply fan capacity will increase accordingly: CV & SZVAV: Supply fan operation at full airflow will be utilized.
- VAV: Once the supply fan proving switch is closed, the supply fan speed will ramp to 50% command, then control to normal discharge static pressure control limited by the high duct static limit.
- Building pressure will always be in control.
- The unit will indicate via local HI and remote BAS that the RR event is active.
- Valid RR temperature sensor or return air temperature sensor is required to determine initialization and deactivation of RR relative to RR critical temperature setpoint. If this sensor fails, the unit will terminate RR when the discharge temperature sensor indicates a value below the active SA cooling setpoint – 1/2 deadband.
- Limit OA humidity infiltration to humidity greater than 20% RH.

Application Considerations

High Capacity Evaporator

Rooftops are popular because of their “packaged” nature. Everything needed is contained in one box; mix-matching is neither necessary nor available. With this convenience comes some disadvantages, among them correctly matching cooling capacity to building load. For example, a 105 ton rooftop would need to be used on an application that is 91 tons, simply because the ton rooftop does not meet capacity. Matching the rooftop’s capacity to the building load is critical, which is why the IntelliPak line offers a high capacity coil option on its rooftops.

Capacity tables for both standard and high capacity units are available in the cooling data section of this catalog. Use the pressure drops associated with the high capacity coil option by adding them to the total static pressure used to size the supply fan motor. eFlex™, variable speed compressors also help units match the load needed by varying the compressor down to 15% of full load.

eFlex™ Variable Speed

A state of the art Trane eFlex™ variable speed compressor is combined with fixed capacity compressors to provide a superior part load efficiency (IEER) option. Compressor designs are optimized and selected to maximize part load performance. Continuous capacity from 15-100% means that discharge air temperature is controlled within +/-1°F. This eliminates discharge air temperature swings caused by cycling fixed capacity compressors, improves humidity control, and leads to increased comfort in the space.

Exhaust/Return Fan Options

When is it necessary to provide building exhaust? Whenever an outdoor air economizer is used, a building generally requires an exhaust system. The purpose of the exhaust system is to exhaust the proper amount of air to prevent over or under-pressurization of the building. The goal is to exhaust approximately 10% less air than the amount of outside air going into the building. This maintains a slightly positive building pressure.

The reason for applying either a return, or exhaust fan is to control building pressure. The Trane 100% modulating exhaust system with Statitrac is an excellent choice for controlling building pressure in the majority of applications. For more demanding applications, Trane's 100% modulating return fan system with Statitrac is an excellent choice for systems with high return static pressure losses, or duct returns. Both systems employ direct digital control technology to maintain building pressure. Either return or exhaust fan systems with Statitrac may be used on any rooftop application that has an outdoor air economizer.

A building may have all or part of its exhaust system in the rooftop unit. Often, a building provides exhaust external to the air conditioning equipment. This external exhaust must be considered when selecting the rooftop exhaust system.

With an exhaust fan system, the supply fan motor and drives must be sized to overcome the total system static pressure, including return losses, and pull return air back to the unit during non-economizer operation. However, a supply fan can typically overcome return duct losses more efficiently than a return air fan system. Essentially, one large fan by itself is normally more efficient than two fans in series because of only one drive loss, not two as with return fan systems.

In a return fan system, the return fan is in series with the supply fan, and operates continuously whenever the supply fan is operating to maintain return air volume. The supply fan motor and drives are sized to deliver the design CFM based on internal and discharge static pressure losses only. The return fan motor and drives are sized to pull the return CFM back to the unit based on return duct static. Therefore, with a return fan system, the supply fan ordinarily requires less horsepower than a system with an exhaust fan.

Exhaust/Return Fan Systems

- 100% modulating exhaust with Statitrac direct space sensing building pressurization control (with or without exhaust variable frequency drives)
- 100% modulating exhaust without Statitrac
- 100% modulating plenum return airfoil fan with Statitrac direct space sensing building pressurization control with variable frequency drive
- 100% modulating plenum return airfoil fan without Statitrac
- Drivers for applying either return or exhaust fan systems include economy, building pressure control, code requirements, and generally accepted engineering practices

Application Recommendations

100% Modulating Exhaust with Statitrac™ Control, Constant Volume (CV) and Variable Air Volume (VAV) Units

For both CV and VAV rooftops, the 100% modulating exhaust discharge dampers (or VFD) are modulated in response to building pressure. A differential pressure control system, Statitrac, uses a differential pressure transducer to compare indoor building pressure to atmospheric pressure. The FC exhaust fan is turned on when required to lower building static pressure to setpoint. The Statitrac control system then modulates the discharge dampers (or VFD) to control the building pressure to within the adjustable, specified deadband that is set at the Human Interface Panel. Economizer and return air dampers are modulated independent of the exhaust dampers (or VFD) based on ventilation control and economizer cooling requests.

Advantages:

- The exhaust fan runs only when needed to lower building static pressure.
- Statitrac compensates for pressure variations within the building from remote exhaust fans and makeup air units.
- The exhaust fan discharges in a single direction resulting in more efficient fan operation compared to return fan systems.
- When discharge dampers are utilized to modulate the exhaust airflow, the exhaust fan may be running unloaded whenever the economizer dampers are less than 100% open.

The Trane 100% modulating exhaust system with Statitrac provides efficient control of building pressure in most applications simply because 100 percent modulating exhaust discharge dampers (or VFD) are controlled directly from building pressure, rather than from an indirect indicator of building pressure, such as outdoor air damper position.

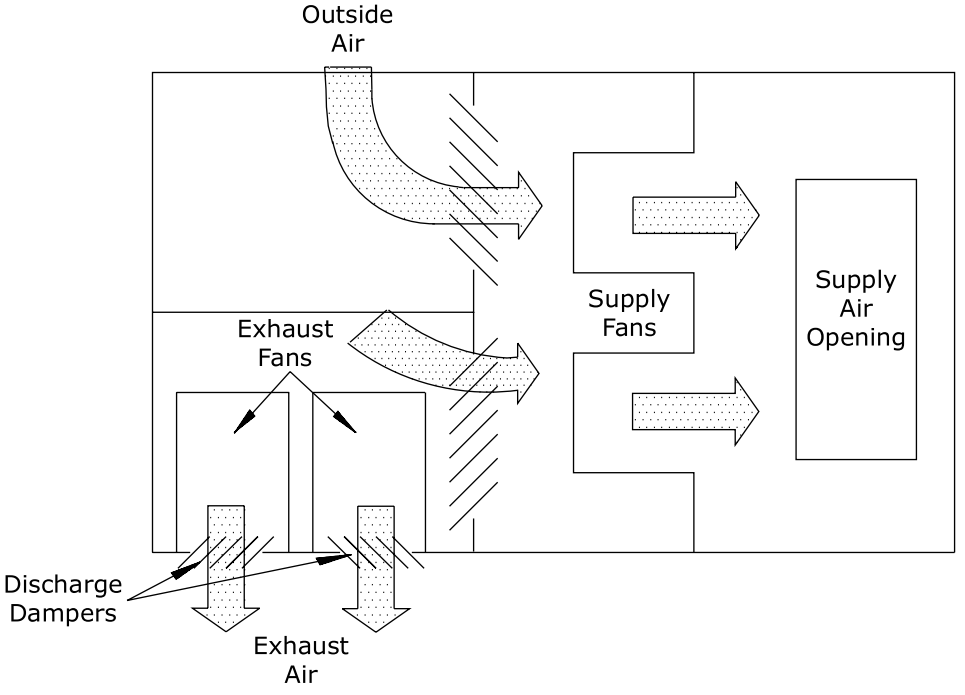
100% Modulating Exhaust System without Statitrac, Constant Volume (CV) Units Only

This fan system has performance capabilities equal to the supply fan. The FC exhaust fans are started by the economizer's outdoor air damper position and the exhaust dampers track the economizer outdoor air damper position. The amount of air exhausted by this fan is controlled by modulating discharge dampers at the fan outlet. The discharge damper position is controlled by a signal that varies with the position of the economizer dampers. When the exhaust fans start, the modulating discharge dampers are fully closed, and exhaust airflow is 15 to 20% of total exhaust capabilities. The Trane 100 percent modulating exhaust system provides excellent linear control of building exhaust in most applications where maintaining building pressure is not important.

Advantages:

- The exhaust fan runs only when the economizer reaches the desired exhaust enable point.
- Exhaust dampers are modulated based on the economizer position.
- When discharge dampers are utilized to modulate the exhaust airflow, the exhaust fan may be running unloaded whenever the economizer dampers are less than 100 percent open.

Figure 24. Plan view of modulating 100-percent exhaust system



100% Modulating Exhaust with or without Statitrac Control, SZVAV Units

The overall scheme will remain very similar to non-Single Zone VAV units with Space Pressure Control with the exception of the dynamic Exhaust Enable Setpoint.

For SZVAV the user will select an Exhaust Enable Setpoint during the 100% Fan Speed Command. Once selected, the difference between the Exhaust Enable Setpoint and Design OA Damper Minimum Position at 100% Fan Speed Command will be calculated. The difference calculated will be used as an offset to be added to the Active Building Design OA Minimum Position Target to calculate the dynamic Exhaust Enable Target to be used throughout the Supply Fan Speed/OA Damper Position range.

Advantages:

- The exhaust fan runs only when the economizer reaches the desired exhaust enable point.
- Exhaust dampers are modulated based on the economizer position.
- The exhaust fan discharges in a single direction resulting in more efficient fan operation compared to return fan systems.
- When discharge dampers are utilized to modulate the exhaust airflow, the exhaust fan may be running unloaded whenever the economizer dampers are less than 100% open.

The Trane 100% modulating exhaust system provides excellent linear control of building exhaust in most applications where maintaining building pressure is not important.

100% Modulating Return Fan Systems with Statitrac Control, Constant Volume (CV) and Variable Air Volume (VAV) Units

For both CV and VAV applications, the IntelliPak 2 rooftop unit offers 100% modulating return fan systems. A differential pressure control system, Statitrac, uses a differential pressure transducer to compare indoor building pressure to atmospheric pressure.

The return fan exhaust dampers are modulated, based on space pressure, to control the building pressure to within the adjustable, specified deadband that is set at the Human Interface Panel. A VFD modulates the return fan speed based on return duct static pressure.

Economizer and return air dampers are modulated independent of the exhaust dampers based on ventilation control and economizer cooling requests.

Advantages:

- The return fan operates independently of the supply fan to provide proper balance throughout the airflow envelope.
- Statitrac compensates for pressure variations within the building from remote exhaust fans and makeup air units.
- The return fan acts as both exhaust and return fan based on operation requirements.

The Trane 100% modulating return system with Statitrac provides efficient control of building pressure in applications with higher return duct static pressure and applications requiring duct returns. Exhaust discharge dampers are controlled directly from building pressure, return fan VFD is controlled from return static pressure, and return/economizer dampers are controlled based on ventilation control and economizer cooling requests.

100% Modulating Return Fan without Statitrac Control, Constant Volume (CV) Units Only

The return fan runs continuously while the supply fan is energized. The exhaust discharge dampers are modulated in response to building pressure. Economizer and return air dampers are modulated independent of the exhaust dampers based on ventilation control, and economizer cooling requests.

Advantages:

- The return fan enhances total system static capability.
- The return fan discharges in two directions, thereby balancing exhaust and unit return air volumes.

Other Cooling Options

Cooling, Rapid Restart Units Only

This is for applications where the space has a high heat load with critical temperature control requirements. A typical application is a computer room that has a large number of routers and servers. If the cooling capacity is lost due to a power interruption, the temperature in the room can rise as much as 3-4°F per minute. Once power is restored (e.g., backup generator has started), the cooling capacity needs to be maximized as soon as possible to help get the space under control. Once cooling capacity has been maximized, the unit can then manage the load using its normal capacity control algorithms.

Supply and Return Airflow Configurations

The typical rooftop installation has both the supply and return air paths routed through the roof curb and building roof. However, many rooftop installations require horizontal supply and/or return from the rooftop because of a building's unique design or for acoustic considerations.

There are several ways to accomplish horizontal supply, see Table 3, p. 47 and/or Table 4, p. 48.

Figure 25. Left/right unit orientation and horizontal airflow

Horizontal - Right	Yes	Yes	Yes	Yes
Horizontal - Left	No	Field Convert	No	No
Horizontal - End	Yes	Yes	No	No

Note: *For left/right unit orientation, see Figure 25, p. 47.*

When using an IntelliPak 2 Rooftop for horizontal supply and/or return, an additional pressure drop must be added to the supply external static to account for the 90 degree turn the air is making. This additional pressure drop depends on airflow and rooftop size, but a range of 0.10 inches to 0.30 inches can be expected. The openings on the rooftop all have a one inch lip around the perimeter to facilitate ductwork attachment.

Corrosive Atmospheres

Trane's IntelliPak Rooftops are designed and built to industrial standards and will perform to those standards for an extended period depending on the hours of use, the quality of maintenance performed, and the regularity of that maintenance. One factor that can have an adverse effect on unit life is its operation in a corrosive environment. Since the Microchannel condenser coil is an all-aluminum design, it provides a high level of corrosion protection on its own. Uncoated, it withstands a salt spray test in accordance with ASTM B117 for 1,000 hours. When rooftops are operated in highly corrosive environments, Trane recommends the corrosion protected condenser coil option.

This corrosion protection option meets the most stringent testing in the industry, including ASTM B117 Salt Spray test for 6,000 hours and ASTM G85 A2 Cyclic Acidified Salt Fog test for 2,400 hours. The acid fog test is the most stringent available today. This coating is added after coil construction covering all tubes, headers, fins and edges. The design provides superior protection from any corrosive agent. For evaporator coils, copper fins can be utilized as a design special.

Note: *Field coating is not allowed on Microchannel coils.*

Ventilation Override Sequences

One of the benefits of using an exhaust fan rather than a return fan, in addition to the benefits of lower energy usage and improved building pressurization control, is that the rooftop can be used as part of a ventilation override system. Several types of sequences can be easily done when exhaust fans are a part of the rooftop system.

What would initiate the ventilation override control sequence? Typically, a manual switch is used and located near the fire protection control panel. This enables the fire department access to the control for use during or after a fire. It is also possible to initiate the sequence from a field-installed automatic smoke detector. In either case, a contact closure begins the ventilation override control sequence.

Trane can provide five (5) different ventilation override sequences on both CV and VAV IntelliPak rooftops. For convenience, the sequences are factory preset but are fully field edited from the Human Interface Panel or Tracer. Any or all five sequences may be “locked” in by the user at the Human Interface Panel.

The user can customize up to five (5) different override sequences for purposes such as smoke control. The following parameters within the unit can be defined for each of the five sequences:

- Supply Fan - on/off
- Variable Frequency Drives - on (60 Hz)/off (0 Hz)/controlling
- Exhaust/Return Fan - on/off
- Exhaust Dampers - open/closed
- Economizer dampers - open/closed
- Heat - off/controlling (output for) VAV Boxes - open/controlling

Compressors and condenser fans are shut down for any Ventilation Override sequence. Factory preset sequences include unit Off, Exhaust, Purge, Purge with duct pressure control, and Pressurization. Any of the user-defined Ventilation Override sequences can be initiated by closing a field supplied switch or contacts connected to an input on the Ventilation Override Module. If more than one ventilation override sequence is being requested, the sequence with the highest priority is initiated. Refer to the Ventilation Override Module (VOM) information in the Control section of this catalog for more details on each override sequence.

Natural Gas Heating Considerations

Trane uses heavy gauge 304 L stainless steel throughout the construction of its natural gas drum and tube heat exchangers. These heat exchangers can be applied with confidence, particularly with full modulation control, when mixed air temperatures are below 50°F, and low ambient temperatures can cause condensation to form on the heat exchanger. The IntelliPak natural gas heat exchangers are not recommended for applications with mixed air conditions entering the heat exchanger below 30°F to ensure adequate leaving air heating temperature. For airflow limitations and temperature rise across the heat exchanger information, see Table 58, p. 119.

Acoustical Considerations

The ideal time to make provisions to reduce sound transmission to the space is during the project design phase. Proper placement of rooftop equipment is critical to reducing transmitted sound levels to the building. The most economical means of avoiding an acoustical problem is to place any rooftop equipment away from acoustically critical areas. If possible, rooftop equipment should not be located directly above areas such as: offices, conference rooms, executive office areas and classrooms. Ideal locations are above corridors, utility rooms, toilet facilities, or other areas where higher sound levels are acceptable.

Several basic guidelines for unit placement should be followed to minimize sound transmission through the building structure:

- Never cantilever the condensing section of the unit. A structural cross member must support this end of the unit.
- Locate the unit's center of gravity close to or over a column or main support beam to minimize roof deflection and vibratory noise.
- If the roof structure is very light, roof joists should be replaced by a structural shape in the critical areas described above.
- If several units are to be placed on one span, they should be staggered to reduce deflection over that span.

It is impossible to totally quantify the effect of building structure on sound transmission, since this depends on the response of the roof and building members to the sound and vibration of the unit components. However, the guidelines listed above are experience proven guidelines which will help reduce sound transmission. The ASHRAE publication "A Practical Guide to Noise and Vibration Control for HVAC Systems" also provides valuable information.

There are several other sources of unit sound, i.e., supply fan, compressors, exhaust/return fans, condenser fans and aerodynamic noise generated at the duct fittings. Refer to the ASHRAE Applications Handbook, Chapter 47, 2003 edition for guidelines for minimizing the generation of aerodynamic noise associated with duct fittings. A good source of information on general acoustical considerations for rooftops is the 2000 ASHRAE Journal article titled, "Controlling Noise from Large Rooftop Units."

The Trane Acoustic Program (TAP) allows complete modeling of rooftop acoustical installation parameters. The software models airborne sound from supply and return ducts, as well as duct breakout and roof transmission sound, so that the designer can identify potential sound problems and make design alterations before equipment installation. Output of the program shows the resulting NC (or RC) level for any point in the occupied space. TAP is also capable of modeling the effect of outdoor sound on the surrounding area. This program is available from Trane's Customer Direct Service Network (C.D.S.), ask your local Trane representative for additional information on this program.

High Entering Return Temperature Applications

Some applications may have high entering return temperatures, such as data centers. It is recommended that the dry bulb temperatures in any application not exceed 95°F for extended periods of time. If this is a requirement, please work with the Applications or Product Support group in developing a specific assessment. Other factors, such as wet bulb and ambient temperatures, will also affect the system's reaction.

Clearance Requirements

The recommended clearances identified in unit dimensions should be maintained to assure adequate service capability, maximum capacity and peak operating efficiency. A reduction in unit clearance could result in condenser coil starvation or warm condenser air recirculation. If the clearances shown are not possible on a particular job, consider the following:

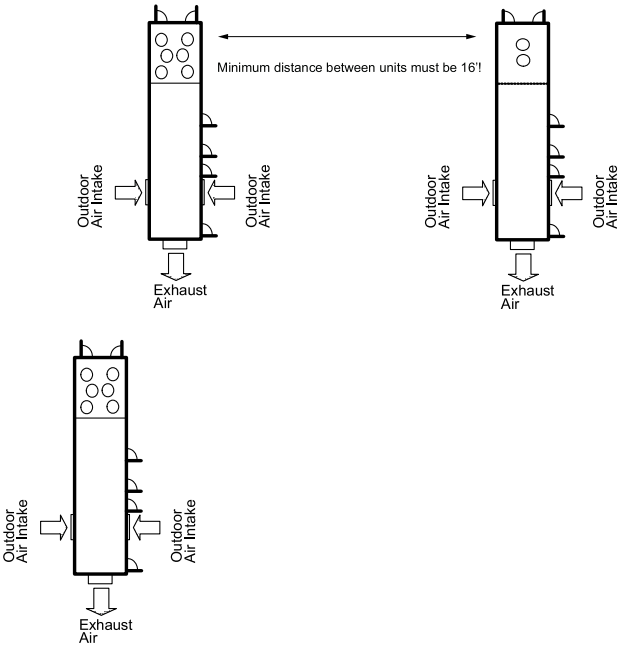
- Do the clearances available allow for major service work such as changing compressors or coils?
- Do the clearances available allow for proper outside air intake, exhaust air removal and condenser airflow?
- If screening around the unit is being used, is there a possibility of air recirculation from the exhaust to the outside air intake or from condenser exhaust to condenser intake?
- Do clearances meet all applicable codes?

Actual clearances which appear inadequate should be reviewed with a local Trane sales engineer.

When two or more units are to be placed side by side, the distance between the units should be increased to 150 percent of the recommended single unit clearance. The units should also be staggered, see Figure 26, p. 50, for two reasons:

- To reduce span deflection if more than one unit is placed on a single span. Reducing deflection discourages sound transmission.
- To assure proper diffusion of exhaust air before contact with the outside air intake of adjacent unit.

Figure 26. Unit placement



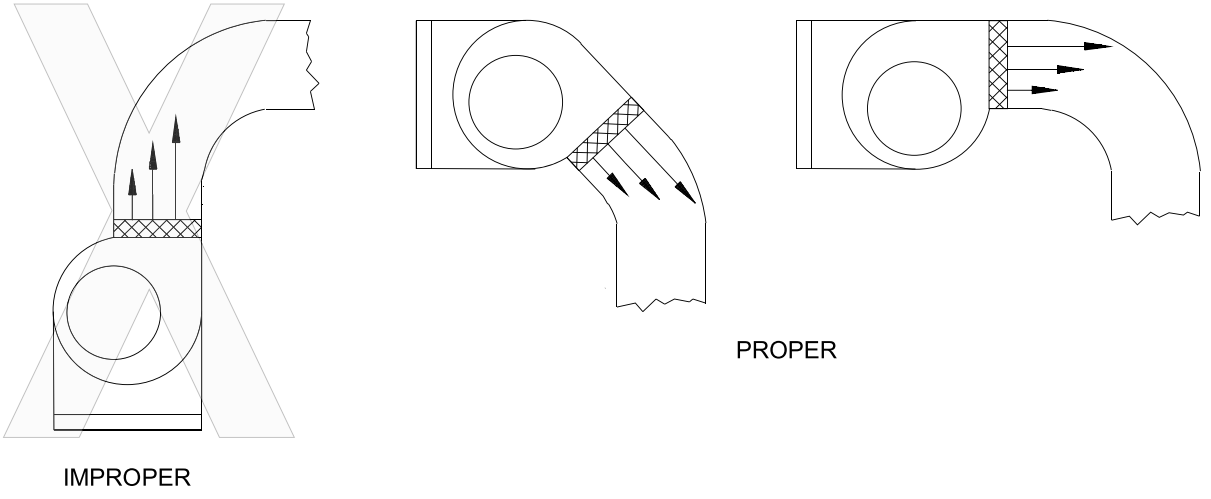
Duct Design

It is important to note that the rated capacities of the rooftop can be met only if the rooftop is properly installed in the field. A well-designed duct system is essential in meeting these capacities.

The satisfactory distribution of air throughout the system requires that there be an unrestricted and uniform airflow from the rooftop discharge duct. This discharge section should be straight for at least several duct diameters to allow the conversion of fan energy from velocity pressure to static pressure.

However, when job conditions dictate elbows be installed near the rooftop outlet, the loss of capacity and static pressure may be reduced through the use of guide vanes and proper direction of the bend in the elbow. The high velocity side of the rooftop outlet should be directed at the outside radius of the elbow rather than the inside as illustrated in .

Figure 27. Duct design



Energy Recovery Wheel

For applications where the air streams within the rooftop must be isolated, consider using alternative technologies that guarantee separation of the air streams.

Important: *Do not use energy wheels in applications where the exhaust air is contaminated with harmful toxins or biohazards or where even a minor mixing of the air streams presents a health risk. See Installation Operation Maintenance (RT-SVX24*-EN) for more information.*

The energy recovery option was designed as a partial flow outside air system, where the required outside air is less than 100 percent. IntelliPak 2 monitors outside air, return air, and zone conditions. It compares them with setpoints (set in the rooftop human interface) and checks for suitable energy recovery system operation. Energy recovery can be activated when both supply and exhaust fans are in operation. Heat can be recovered when the return air dry bulb temperature is greater than the outside air dry bulb temperature.

Energy recovery is disabled when economizer cooling operation is requested. Economizer cooling in energy recovery wheel equipped units requires the exhaust air and outside air bypass dampers to be open and the recovery wheel motor to be off. The energy recovery wheel can provide free cooling when outside air enthalpy is greater than return air enthalpy. In general, energy recovery works well in applications where a high outside airflow minimum is required, often because of high occupancy.

Modulating Hot Gas Reheat

In general, applications where non-peak load conditions can be dominated by latent loads are candidates for the Hot Gas Reheat option. This includes many applications subject to ASHRAE Standard 62 requirements.

When a Hot Gas Reheat coil is energized, it increases the air temperature after exiting the evaporator coil. While this provides dehumidification, this is not a dehumidifier. The main function of the Packaged RTU is to provide zone temperature control. For times when dehumidification is needed, the hot gas reheat will be energized.

Applications which should be investigated before using the standard modulating hot gas reheat option, and will require additional investigation include the following:

- Process applications
- Units utilized as a make-up air or 100% outside air units
- Zones with dramatically varying load conditions (sanctuaries, locker rooms, gymnasiums, etc.

Generally, the standard Modulating Hot Gas Reheat option requires a call for cooling to initiate. If there is no call for cooling, and there is a desire for dehumidification, another solution will need to be investigated. The IntelliPak™ packaged rooftop systems include non-standard solutions which can be considered for these types of applications.

Evaporative Condenser

Water Supply—Suspended particulate matter, mineral concentrations, trash and debris can adversely affect performance of any water-cooled device. If not managed, mineral concentrations can result in clogged water system hardware, heat exchanger restriction and heat transfer loss. Trane's evaporative condenser is designed to greatly minimize performance problems that may occur from the by-products of water evaporation.

Incoming Water Supply Line—A float valve is provided to maintain sump water level during condenser operation. A field installed gate valve may be installed on the condenser water supply line. An 80 to 100 mesh field supplied strainer may be installed in the condenser water supply line to help prevent the introduction of debris. The condenser water supply line should be flushed thoroughly prior to connection to the unit. Local codes may require back-flow prevention on the condenser water supply line.

Water Discharge and Drain Line—Care and judgment should be exercised in selecting a water discharge site.

Local Site Discharge—Rooftop or simple storm sewer discharge is generally acceptable. Do not routinely direct sump discharge onto areas where the byproducts of water evaporation or water treatment products are undesirable.

Sewer Discharge—The quantities of mineral and debris in the discharge water are actually very small, and do not cause problems when diluted in normal sewer flow. Check local codes to identify any special requirements for sewer discharge. Regardless of the disposal method used, local codes, state or federal standards for water disposal must be followed.

Freeze Protection—For operation in ambient temperatures below 32°F, optional sump heater and controls are available to provide operation down to 10°F. In colder climates water supply line and drain piping will require field installed freeze protection. Generally low wattage heat tape on the water lines is sufficient protection.

Make-up Water Considerations:

Water Saving Methods—A programmable flush cycle is initiated to remove mineral deposits and particulates from the sump. Fresh water can be cycled into the sump as a portion of the existing water is drained. The intervals between drains are adjustable from 0 - 12 hours. When set to 0, the periodic blowdown is disabled.

A more efficient approach is utilizing the Conductivity Controller option, which performs blowdowns based on water quality readings from the conductivity sensor in the sampling tube. Users can set a limit based on water quality testing they have performed in their area, when this adjustable setpoint is exceeded the unit will conduct a blowdown for a period of time set by the

user. This allows the user to save water by only performing blowdowns when they are required. Water level is maintained by the internal float valve.

Water Treatment—Water treatment is required on all evaporative condensing units. Even when an optional Dolphin WaterCare System is utilized, water must still be maintained and monitored throughout the unit life cycle.

Note: *Local codes may require the use of chemicals for water treatment. Different chemical feeder systems are available to fit a wide variety of requirements and budgets. Check with local code officials to determine installation requirements.*

Low Ambient Operation — Remote Human Interface Recommendation

Who wants to be on a roof at subzero temperatures? We can understand a service technician's reluctance to do this; that's why we offer a remote mounted human interface panel. The service technician can troubleshoot and diagnose in the comfort of a mechanical room.

Selection Procedure

This section outlines a step-by-step procedure that may be used to select a Trane air-cooled single-zone air conditioner. Air-cooled models should be selected based on dry bulb (DB) conditions. For specific model selection, utilize TOPSS or contact the local Trane Sales Office. This sample selection is based on the following conditions:

Note: *When calculating capacities for evaporative condensers, use ambient wet bulb (WB).*

Summer Design	
Summer outdoor design conditions	95 DB/76 WB ambient temperature
Summer room design conditions	78 DB/65 WB
Total cooling load	980 MBh (81.6 tons)
Sensible cooling load	735 MBh (61.25 tons)
Outdoor air ventilation load	154.0 MBh (12.8 tons)
Return air temperature	78 DB/65 WB
Winter design:	
Winter outdoor design conditions	0°F
Return air temperature	70°F
Total heating load	720 MBh
Winter outdoor air ventilation load	288.6 MBh
Total winter heating load	1008.6 MBh
Air delivery data:	
Supply fan CFM	36,000 CFM
External duct static pressure	1.86 in wg
Minimum outdoor air ventilation	3,600 CFM
Exhaust fan CFM	36,000 CFM
Return air duct negative static pressure	0.3 in wg
Electrical characteristics:	
Voltage/cycle/phase	460/60/3
Unit Accessories	• Gas fired heat exchanger - high heat • Downflow supply and upflow return • High efficiency throwaway filters • Economizer • Modulating 100% exhaust

Cooling Capacity Selection

1. **Nominal Unit Size Selection**

   A summation of the peak cooling load and the outside air ventilation load shows: 980 MBh + 154.0 MBh = 1134.0 MBh required unit capacity. From Table 14, p. 72, a 105 ton unit with standard capacity evaporator coil at 80 DB / 65 WB, 95°F outdoor air temperature and 36,000 total supply CFM is 1,237 MBh total and 1,037 MBh sensible. Thus, a nominal 105 ton unit with standard capacity evaporator coil is selected.

2. **Evaporator Coil Entering Conditions**

   Mixed air dry bulb temperature determination:

Using the minimum percent of OA (3,600 CFM ÷ 36,000 CFM = 10%), determine the mixture dry bulb to the evaporator.

RADB + % OA (OADB - RADB) = 78 + (0.10) (95 - 78) = 78 + 1.5 = 79.5°F

Approximate wet bulb mixture temperature:

RAWB + % OA (OAWB - RAWB) = 65 + (0.10) (76 - 65) = 65 + 1.1 = 66.1°F

3. **Determine Supply Fan Motor Heat Gain**

   Having selected a nominal 105 ton unit, the supply fan bhp can be calculated. The supply fan motor heat gain must be considered in final determination of unit capacity.

Table 5. Determine unit total static pressure at design supply CFM:

Supply Duct Static Pressure	2.2 inches
Evaporator Coil (Table 65, p. 122)	0.64 inches
Return Duct Negative Static Pressure	0.30
Heat Exchanger (Table 65, p. 122)	0.03
Throwaway Filter (Table 65, p. 122)	0.26
Economizer Damper[a] (Table 65, p. 122)	0.57
Unit Total Static Pressure	4.0

[a] Add either the economizer damper value or return damper value, depending on which static pressure is greater. (Do not use both.)

Using total of 36,000 CFM and total static pressure of 4.0 inches, enter 40.4 bhp with 1,097 rpm required for the 36" supply fan. Supply fan motor heat gain = 109.0 MBh, or 109.0 MBh ÷ 36000 CFM x 1.085 = 2.8°F supply fan motor heat. See supply fan graph in Figure 33, p. 115.

4. **Determine Total Required Cooling Capacity**

   Required capacity = Total peak load + OA load + supply air fan motor heat

   Required capacity = 980.0 + 154.0 + 109.0 = 1243.0 MBh (103.6 tons)

5. **Determine Unit Capacity**

   From Table 14, p. 72, unit total capacity at 79.5 DB/66.1 WB entering the evaporator, 36,000 supply air CFM, 95°F outdoor ambient is 1,251 MBh (104.2 tons) with 996 MBh (83 tons) sensible capacity.

6. **Determine Leaving Air Temperature**

   Unit sensible heat capacity corrected for supply air fan motor heat = 996 MBh sensible - 109.0 MBh motor heat = 887 MBh.

   Supply air dry bulb temperature difference =

$$\frac{\text{Sensible Btu}}{1.085 \times \text{Supply CFM}} =$$

Sensible Btu = 887 MBh /(1.085 x 36,000 CFM) = 23.0

Supply air dry bulb = 79.5 DB - 23.0 = 56.5 leaving evaporator coil

$$\frac{\text{Total Btu}}{4.5 \times \text{Supply CFM}} =$$

Unit enthalpy difference = 1,251 MBh ÷ (4.5 x 36,000 CFM) = 7.72 Btu/lb.

Leaving enthalpy = h (ent WB) - h (diff). From Table 9, p. 68, h (ent WB) = 30.9 Btu/lb.

Leaving enthalpy = 30.9 Btu/lb. - 7.72 Btu/lb. = 23.18 Btu/lb.

Supply air wet bulb = 54.9 leaving evaporator coil.

Leaving air temperature = 56.5 DB/54.9 WB

Heating Capacity Selection

1. **Determine air temperature entering heating module**

   Mixed air temperature = RADB + % OA (OADB - RADB) = 70 + (0.10) (0 - 70) = 63°F

   Supply air fan motor heat temperature rise = 109000 Btu ÷ (1.085 x 36000 CFM) = 2.8°F

   Air temperature entering heating module = 63.0 + 2.8 = 65.8°F

2. **Determine total winter heating load**

   Total winter heating load = peak heating load + ventilation load - supply fan motor heat = 720 + 288.6 - 109.0 = 899.6 MBh

   a. **Electric heating system**

      Unit operating on 460/60/3 power supply.

      From Table 59, p. 119, kW may be selected for a nominal 105 ton unit operating 460-volt power. The 265 kW heat module (904.4 MBh) will satisfy the winter heating load of 899.6 MBh.

      Table 59, p. 119 shows an air temperature rise of 23.2°F for 36,000 CFM through the 265 kW heat module.

      Unit supply temperature at design heating conditions = mixed air temperature + air temperature rise = 65.8°F + 23.2°F = 89.0°F.

   b. **Gas heating system (natural gas)**

      From Table 58, p. 119 select the high heat module (1,440 MBh output) to satisfy winter heating load of 899.6 MBh at unit CFM.

      Table Table 58, p. 119 also shows an air temperature rise of 37.0°F for **36,000 CFM** through the heating module.

      Unit supply temperature at design heating conditions = mixed air temperature + air temperature rise = 65.8°F + 37.0°F = 102.8°F.

   c. **Hot water heating system**

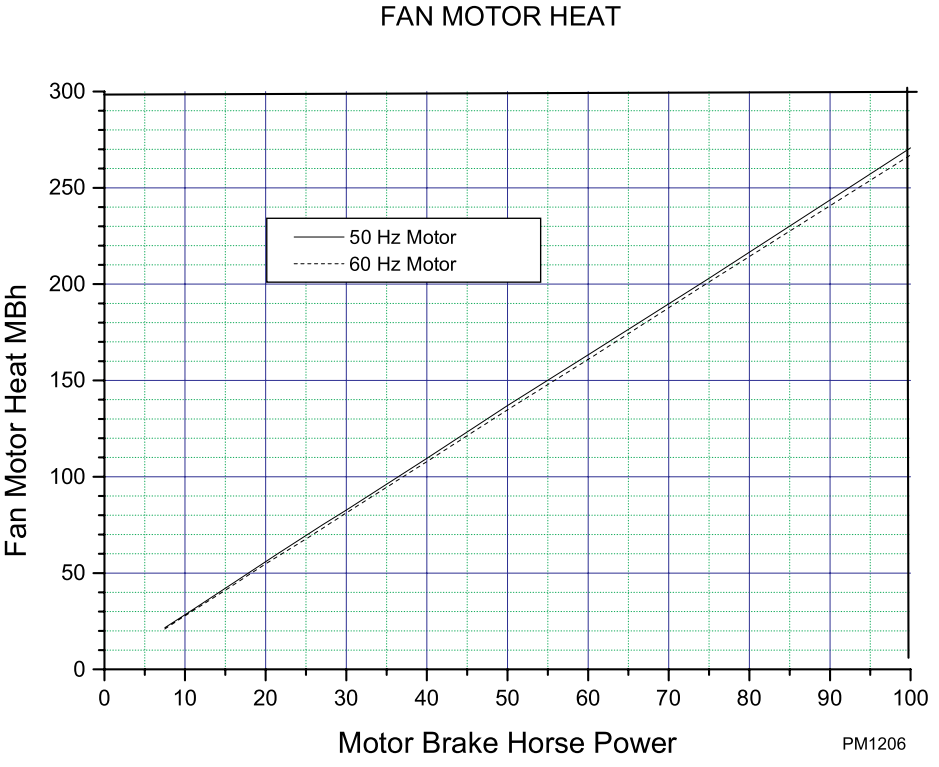
      Assume a hot water supply temperature of 190°F and an entering coil temperature of 65.8°F.

      Subtract the mixed air temperature from the hot water temperature to determine the ITD (initial temperature difference).

      ITD = 190°F - 65.0°F = 125°F. Divide the winter heating load by ITD = 1008.6 MBh ÷ 125°F = 8.0 Q/ITD.

      From Table 62, p. 120, select the low heat module. By interpolation, a Q/ITD of 8.0 can be obtained at a gpm of 40.0. Water pressure drop at 40.0 gpm is 0.33 ft. of water.

Figure 28. Fan motor heat



Heat module temperature rise is determined by:

$$\frac{\text{Total Btu}}{1.085 \times \text{Supply CFM}} = \Delta T$$

$$\frac{1008600}{1.085 \times 36000} = 25.8$$

Unit supply air temperature = mixed air temperature + air temperature rise = 65.4 + 25.8 = 91.2°F.

d. **Steam heating system**

Assume a 15 psig steam supply.

From Table 64, p. 122, the saturated temperature steam is 250°F. Subtract mixed air temperature from the steam temperature to determine ITD.

ITD = 250°F - 65.0°F = 185°F.

Divide winter heating load by ITD = 1008.6 MBh ÷ 185°F = 5.45 Q/ITD.

From Table 63, p. 121, select the low heat module. The low heat module at 36,000 CFM has a Q/ITD = 7.45.

Heat module capacity, Q = ITD x Q/ITD = 185°F x 7.45 Q/ITD = 1378 MBh

Heat module air temperature rise is determined by:

$$\frac{\text{Total Btu}}{1.085 \times \text{Supply CFM}} = \Delta T$$

$$\frac{1378000}{1.085 \times 36000} = 35.3$$

Unit supply temperature at design conditions = mixed air temperature + air temperature rise = 65.4°F + 35.3°F = 100.7°F.

e. **Air delivery procedure**

Supply fan performance tables include internal resistance of rooftop. For total static pressure determination, system external static must be added to appropriate component static pressure drop (evaporator coil, filters, optional economizer, optional exhaust fan, optional heating system, optional cooling only extended casing).

f. **Supply fan motor sizing**

The supply fan motor selected in the cooling capacity determination was 40.4 bhp and 1,097 rpm. Thus, a 40 hp supply fan motor is selected.

Enter Table 72, p. 129 to select the proper drive. For a 105 ton rooftop with 40 hp motor, a drive letter A - 1,100 rpm is selected.

g. **Exhaust fan motor sizing**

The exhaust/return fan is selected based on total return system negative static pressure and exhaust fan CFM. Return system negative static includes return duct static, and any other job site applicable static pressure drop.

Return duct static pressure = 0.30 inches.

Total return system negative static pressure = 0.30 inches.

Exhaust fan CFM = 36,000 CFM

From the exhaust fan curve (Figure 36, p. 117), the required bhp is estimated at 21 bhp at 400 rpm. Thus, the exhaust fan motor selected is 25 hp.

To select a drive, enter Table 73, p. 130 for a 25 hp motor for a 105 ton unit. Drive selection number 4 - 400 rpm.

h. **Return fan motor sizing**

Return fan drive selection is shown on Table 74, p. 130. The same static pressure and CFM considerations must be taken for return fan size, horsepower, and drive selection as are required for exhaust fan sizing. However, since the return fan runs continuously the sensible heat generated by the return fan motor must be included in the entering evaporator coil mixed air temperature equation.

In this selection, if the return motor bhp is equal to the exhaust motor bhp, 21.44 bhp = 58.1 MBh ÷ (1.085 x 36,000 Return CFM) = 1.5°F added to the return air temperature.

Where altitudes are significantly above sea level, use Table 10, p. 69 and Figure 29, p. 68 for applicable correction factors.

i. **Unit Electrical Requirements**

Selection procedures for electrical requirements for wire sizing amps, maximum fuse sizing, and dual element fuses are given in the electrical service section of this catalog.

j. **Altitude Corrections**

The rooftop performance tables and curves of this catalog are based on standard air (.075 lbs/ft). If the rooftop airflow requirements are at other than standard conditions (sea level), an air density correction is needed to project accurate unit performance.

Figure 29, p. 68 shows the air density ratio at various temperatures and elevations. Trane rooftops are designed to operate between 40° and 90°F leaving air temperature. The procedure to use when selecting a supply or exhaust/return fan on a rooftop for elevations and temperatures other than standard is as follows:

- Determine the air density ratio using Figure 29, p. 68.
- Divide the static pressure at the nonstandard condition by the air density ratio to obtain the corrected static pressure.
- Use the actual CFM and the corrected static pressure to determine the fan rpm and

bhp from the rooftop performance tables or curves.

- The fan rpm is correct as selected.
- Bhp must be multiplied by the air density ratio to obtain the actual operating bhp.

In order to better illustrate this procedure, the following example is used: Consider a 90 ton rooftop unit that is to deliver 32,000 actual CFM at 3-inches total static pressure (tsp), 55°F leaving air temperature, at an elevation of 5,000 ft.

- From Figure 29, p. 68, the air density ratio is 0.86.
- Tsp = 3.0-inches / 0.86 = 3.49 inches tsp.
- From the supply fan curve Figure 31, p. 114 a 90 ton rooftop will deliver 32,000 CFM at 3.49 inches TSP at 997 rpm and an estimated 30 bhp.
- Bhp = 30 x 0.86 = 25.8 bhp actual.
- The rpm is correct as selected - 997 rpm.

Compressor MBh, SHR, and kW should be calculated at standard and then converted to actual using the correction factors in Table 10, p. 69. Apply these factors to the capacities selected at standard CFM so as to correct for the reduced mass flow rate across the condenser. Heat selections other than gas heat will not be affected by altitude. Nominal gas capacity (output) should be multiplied by the factors given in Table 11, p. 69 before calculating the heating supply air temperature.

Evaporative Condensing Rooftop

For unit selection, air-cooled or evaporative condensers can be selected using the same calculations, however evaporative condenser capacities should be calculated based on Wet Bulb (WB) temperatures. For specific model selection, utilize TOPSS or contact the local Trane Sales Office.

Total Energy Recovery Wheel

Utilize TOPSS or contact the local Trane sales office to calculate required return air preheat temperature for the given minimum outdoor air temperature and return air relative humidity.

To calculate the supply and exhaust air conditions leaving the wheel, you must know the wheel effectiveness. Refer to Table 71, p. 129 for total effectiveness measurements.

Note: *The effectiveness numbers shown assume equal supply and exhaust airflows. If the airflows are unbalanced, the effectiveness changes. Use TOPSS to determine effectiveness values for these conditions.*

Calculate Wheel Performance

Use the following equations to calculate supply air conditions. Use TOPSS to calculate exhaust air conditions and to obtain actual dry bulb temperature and enthalpy values for coil and equipment sizing.

1. Dry bulb temperature:

   Cooling: Tsa = Toa - (E x (Toa-Tra))

   Heating: Tsa = Toa + (E x (Tra-Toa))

   where:

   Tsa = Dry bulb temperature of supply air (°F)

   Toa = Dry bulb temperature of outside air (°F)

   Tra = Dry bulb temperature of return air (°F)

   E = Sensible Effectiveness

2. Enthalpy:

   Cooling: Hsa = Hoa - (E x (Hoa-Hra))

   Heating: Hsa = Hoa + (E x (Hra-Hoa))

where:

Hsa = Enthalpy of supply air (Btu/ lb)

Hoa = Enthalpy of outside air (Btu/ lb)

Hra = Enthalpy of return air (Btu/lb)

E = Total Effectiveness

After calculating these two points, use a psychrometric chart to obtain the supply air wet bulb temperature and/or grains moisture.

3. Energy wheel application example

   In this example, a wheel sized for nominal 10,500 CFM will be used for the initial evaluation. The air pressure drop is 1.07 in. wg and the total effectiveness is 73% (see Table 71, p. 129). The total and latent effectiveness values are close to equal for Trane energy wheels. For this example, total effectiveness is assumed to be 73% in cooling mode and 75% in heating mode. TOPSS could be used to obtain the exact values.

   a. Supply air conditions, cooling mode:

      Tsa = Toa - (E x (Toa - Tra)) = 95°F - (.73 x (95°F - 75°F))= 81°F

      Hsa = Hoa - (E x (Hoa - Hra)) = 38.4 Btu/lb - (.73 x (38.4 Btu/ lb - 26.0 Btu/lb) = 29.3 Btu/lb

      According to a psychrometric chart, the supply air wet bulb temperature is 64.4°F, 64 grains/lbm.

      Tsa = Toa + (E x (Tra - Toa)) = 10°F + (.75 x (70°F - 10°F)) = 55°F

      Hsa = Hoa + (E x (Hra - Hoa)) = 3.2 Btu/lb + (.75 x (22.7 Btu/lb -3.2 Btu/lb)) = 17.8 Btu/lb

      According to a psychrometric chart, the supply air wet bulb temperature is 45.5°F, 30 grains/lbm.

      When designing the remainder of the air-handling system, remember to account for the air pressure drop imposed by the energy wheel.

Hot Gas Reheat Selection

The hot gas reheat coil is designed to deliver maximum reheat temperatures. Contact the local Trane Sales Office or refer to the IntelliPak TOPSS selection program to determine leaving air temperature, latent capacity, reheat sensible capacity, leaving unit dew point, and moisture removal when the unit is in reheat operation. If the reheat set point is not obtainable at the provided conditions the customer will be required to make adjustments to the conditions or change the reheat set point value. Please note that reheat operation will not be allowed when there is a call for heating or more than 50% call for cooling.

Model Number Description

DIGIT 1: Unit Type

S = Self-Contained (Packaged Rooftop)

Digit 2 — Unit Function

E = DX Cooling, Electric Heat
F = DX Cooling, Natural Gas Heat
L = DX Cooling, Hot Water Heat
S = DX Cooling, Steam Heat
X = DX Cooling, No Heat, Extended Casing

Digit 3 — System Type

H = Single Zone

Digit 4 — Development Sequence

J = Ninth

Digit 5, 6, 7 — Nominal Capacity

090 = 90 Ton Air-Cooled
105 = 105 Ton Air-Cooled
120 = 120 Ton Air-Cooled
130 = 130 Ton Air-Cooled
150 = 150 Ton Air-Cooled
100 = 100 Ton Evap Condenser
118 = 118 Ton Evap Condenser
128 = 128 Ton Evap Condenser
140 = 140 Ton Evap Condenser
162 = 162 Ton Evap Condenser

Digit 8 — Voltage Selection

4 = 460/60/3 XL
5 = 575/60/3 XL
C = 380/50/3 XL

Digit 9 — Heating Capacity Selection

0 = No Heat
1 = Electric heat 90/56 kW 60/50 Hz
2 = Electric heat 140/88 kW 60/50 Hz
3 = Electric heat 265/166 kW 60/50 Hz
4 = Electric Heat 300/188 kW 60/50 Hz
A = Low Gas Heat — 2-stage
B = Medium Gas Heat — 2-stage
C = High Gas Heat — 2-stage
D = Low Gas Heat — Modulating
E = Medium Gas Heat — Modulating
F = High Gas Heat — Modulating

Digit 10 — Heating (continued)

Steam or Hot Water Heat:

G = Low Heat - 1.0" (25mm) Valve
H = Low Heat - 1.25" (32mm) Valve
J = Low Heat - 1.5" (38mm) Valve
K = Low Heat - 2.0" (50mm) Valve
L = Low Heat - 2.50" (64mm) Valve
M = Low Heat - 3.0" (76mm) Valve
N = High Heat - 1.0" (25mm) Valve
P = High Heat - 1.25" (32mm) Valve
Q = High Heat - 1.5" (38mm) Valve
R = High Heat - 2.0" (50mm) Valve
T = High Heat - 2.50" (64mm) Valve
U = High Heat - 3.0" (76mm) Valve

DIGIT 10, 11 — Design Sequence

A-ZZ = (Factory Assigned) Sequence may be any letter A to Z, or any digit 1 to 9.

DIGIT 12 — Unit Configuration Selection

1 = One-Piece Unit w/o Blank Section
2 = One-Piece Unit w/4' Blank Section
3 = One-Piece Unit w/8' Blank Section
4 = Two-Piece Unit w/o Blank Section
5 = Two-Piece Unit w/4' Blank Section
6 = Two-Piece Unit w/8' Blank Section
7 = Three-Piece unit w/o Blank Section
8 = Three-Piece Unit w/4' Blank Section
9 = Three-Piece Unit w/8' Blank Section

DIGIT 13 — Airflow Direction

1 = Downflow Supply/Upflow Return
2 = Downflow Supply/Horiz End Return
3 = Downflow Supply/Horiz Right Return
4 = Right Side Horiz Supply/Upflow Return
5 = Right Side Horiz Supply/Horizontal End Return
6 = Right Side Horiz Supply/Horizontal Right Return

DIGIT 14 — Supply Fan Options

1 = Standard CFM
3 = Standard CFM - TEFC Motor(s)
4 = Low CFM
6 = Low CFM - TEFC Motor(s)
7 = Standard CFM - w/ Motor Shaft Grounding
9 = Standard CFM - TEFC Motor(s) w/ Shaft Grounding
A = Low CFM - w/ Motor Shaft Grounding
C = Low CFM - TEFC Motor(s) w/ Shaft Grounding

DIGIT 15 — Supply Fan Motor Selection

F = 15 hp
G = 20 Hp
H = 25 Hp
J = 30 Hp
K = 40 Hp
L = 50 Hp
M = 60 Hp
N = 75 Hp
P = 100 Hp

DIGIT 16 — Supply Fan RPM Selection

7 = 700
8 = 800
9 = 900
A = 1000
B = 1100
C = 1200
D = 1300
E = 1400
F = 1500
G = 1600
H = 1700
J = 1800
K = 1900
L = 2000

DIGIT 17 — Exhaust/Return Fan Options

0 = None
1 = Std CFM Exhaust Fan w/o Statitrac CV Only
2 = Low CFM Exhaust Fan w/o Statitrac CV Only
3 = Std CFM Exhaust w/o VFD w/ Statitrac
4 = Low CFM Exhaust w/o VFD w/ Statitrac
5 = Std CFM Exhaust w/ VFD w/ Bypass w/ Statitrac
6 = Low CFM Exhaust w/ VFD w/ Bypass w/ Statitrac
7 = Std CFM Exhaust w/ VFD w/o Bypass w/ Statitrac
8 = Low CFM Exhaust w/ VFD w/o Bypass w/ Statitrac
A = Std CFM Return w/o Statitrac CV Only
B = Low CFM Return w/o Statitrac CV Only
C = Std CFM Return w/ VFD w/ Bypass w/ Statitrac
D = Low CFM Return w/ VFD w/ Bypass w/ Statitrac
E = Std CFM Return w/ VFD w/o Bypass w/ Statitrac
F = Low CFM Return w/ VFD w/o Bypass w/ Statitrac

DIGIT 18 — Exhaust/Return Fan Motor Selection
0 = None
D = 7.5 Hp
E = 10 Hp
F = 15 Hp
G = 20 Hp
H = 25 Hp
J = 30 Hp
K = 40 Hp
L = 50 Hp
M = 60 Hp

DIGIT 19 — Exhaust/Return RPM Selection
0 = None
3 = 300
4 = 400
5 = 500
6 = 600
7 = 700
8 = 800
9 = 900
A = 1000
B = 1100
C = 1200
D = 1300
E = 1400

DIGIT 20 — System Control Selection

1 = Constant Volume (CV) (Zone Temperature Control)
2 = CV w/ Discharge Temp Control
4 = VAV w/ VFD Supply w/o Bypass (Discharge Temp Control)
5 = VAV w/ VFD Supply w/ Bypass (Discharge Temp Control)
6 = VAV – Single Zone VAV w/VFD w/o Bypass (Zone Temperature Control)
7 = VAV – Single Zone VAV w/VFD w/ Bypass (Zone Temperature Control)

DIGIT 21 — Outside Air and Economizer Option/Controls
A = 0-25% Motorized Damper
B = Economizer w/Dry Bulb
C = Economizer w/Reference Enthalpy
D = Economizer w/Comparative Enthalpy
E = Econ w/Outside Air Measure/Dry Bulb
F = Econ w/Outside Air Measure/Ref Enthalpy
G = Econ w/Outside Air Measure/Comp Enthalpy
H = Econ w/DCV/Dry Bulb[a]
J = Econ w/DCV/Ref Enthalpy[a]
K = Econ w/DCV/Comp Enthalpy[a]
[a] Requires CO_2 Zone Sensor(s)

DIGIT 22 — Damper Option

0 = Standard
1 = Low Leak
2 = Ultra Low Leak
U = Ultra Low Leak, AMCA 1A, w/ FDD (Design Special)

DIGIT 23— Pre-Evaporator Coil Filter Selection
0 = Two Inch High Efficiency Throwaway
1 = Two Inch Throwaway Rack/Less Filters
2 = 90-95% Bag Filters w/ Prefilters
3 = Bag Filter Rack/Less Filters
4 = 90-95% Cartridge Filters w/ Prefilters
5 = Cartridge Rack/Less Filters
6 = 90-95% Low Pressure Drop Cartridge Filters w/ Prefilters
7 = Low Pressure Drop Cartridge Rack/Less Filters

DIGIT 24 — Blank Section Application Options
0 = None
A = 90-95% Bag w/ Prefilters
B = 90-95% Low Pressure Drop Cartridge w/ Prefilters
C = 90-95%, Cartridge Filters w/ Prefilters
D = 90-95% High Temp Cartridge w/ Prefilters
E = HEPA w/ Prefilters
F = High Temp HEPA w/ Prefilters

DIGIT 25 — Energy Recovery Wheel

0 = None
1 = Low CFM ERW w/ Bypass Defrost
2 = Standard CFM ERW w/ Bypass Defrost

DIGIT 26 — Unit Mounted Power Connection Selection
A = Terminal Block
B = Non-Fused Disconnect
C = Non-Fused Disconnect w/ Powered Convenience Outlet
D = Circuit Breaker w/ high fault SCCR
E = Circuit Breaker w/ high fault SCCR/ Powered Convenience Outlet

DIGIT 27 — Condenser Coil Selection

0 = Air-Cooled Aluminum
A = Evap Condenser
B = Evap Condenser w/ Sump Heater
C = Evap Condenser w/ Dolphin WaterCare System
D = Evap Condenser w/ Dolphin WaterCare System & Sump Heater
E = Evap Condenser w/ Conductivity Controller
F = Evap Condenser w/ Conductivity Controller and Sump Heater
J = Corrosion Protected Condenser Coil

DIGIT 28 — Capacity/Efficiency & Drain Pan Option
0 = Standard Evap Coil w/ Galvanized Drain Pan
A = Standard Evap Coil w/ Stainless Steel Drain Pan
B = High Cap Evap Coil w/ Galvanized Drain Pan
C = High Cap Evap Coil w/ Stainless Steel Drain Pan
V = eFlex™ w/ Std evap coil w/ Galv drain pan
W = eFlex™ w/ Std evap coil w/ SS drain pan
Y = eFlex™ w/ Hi cap evap coil w/ Galv drain pan
Z = eFlex™ w/ Hi cap evap coil w/ SS drain pan

DIGIT 29 — Refrigeration System Selection A
0 = Standard
A = Suction Service Valves
B = Replaceable Core Liquid Filter Driers
C = Suction Service Valves & Replaceable Core Liquid Filter Driers

DIGIT 30 — Refrigeration System Selection B
0 = Standard
1 = Hot Gas Reheat[a]
2 = Hot Gas By-Pass
3 = Hot Gas Reheat[a]/Hot Gas By-Pass
[a] Humidity sensor required

DIGIT 31 — Ambient Control Option

0 = Standard Ambient
1 = Low Ambient

DIGIT 32 — High Duct Temp Thermostat
0 = None
1 = High Duct Temp Thermostat

DIGIT 33 — Controls Option

0 = None
1 = Remote Human Interface (RHI) & Inter-Processor Communication Bridge (IPCB)
2 = IPCB
3 = Rapid Restart

[a] Requires CO_2 Zone Sensor(s)
[b] Humidity sensor required

DIGIT 34 — Module Options

0 = None
A = 0-5 volt Generic Building Automation System (GBAS)
B = 0-10 volt GBAS
C = 0-5 volt GBAS and 0-10 volt GBAS
D = Ventilation Override
F = LonTalk® Communication Interface (LCI)
G = 0-5 volt GBAS volt & Ventilation Override
H = 0-10 volt GBAS & Ventilation Override
J = 0-5 volt GBAS and 0-10 volt GBAS & Ventilation Override
L = LCI & Ventilation Override
M = BACnet Communication Interface (BCI)
N = BCI & Ventilation Override

DIGIT 35 — Zone Sensor Option

0 = None
A = Dual Setpoint w/Man/Auto Changeover — BAYSENS108
B = Dual Setpoint w/Man/Auto Chgovr & Sys Lights — BAYSENS110
C = Room Sensor w/timed Override & Cancel — BAYSENS073
D = Room Sensor w/TO (Timed Override) & Cancel & Local Stpt Adj — BAYSENS074
G = VAV w/System Lights — BAYSENS021
L = Programmable Night Setback — BAYSENS119

DIGIT 36 — Agency Approval Option

0 = None
1 = cULus

DIGIT 37 — Service Enhancements

0 = Single Side Access Door
A = Dual Side Access Door
B = Single Side Access Doors/ Marine Lights
C = Dual Side Access Doors/ Marine Lights

DIGIT 38 — Miscellaneous Options

0 = None
1 = Belt Guards
2 = Burglar Bars
3 = Belt Guards/Burglar Bars

EXAMPLE
Model number SXHJ10540AA715MFDE81D1100A1-BA1000AA1A1 describes a unit with the following characteristics: DX Cooling, No Heat, Extended Casing, 105 Ton nominal capacity, with 460/3/60 power supply, 3 piece construction with downflow supply and upflow return, low CFM fans, a 60 hp supply fan w/ a 1500 rpm drive, a 10 Hp return fan with VFD, bypass and statitrac, with CV control, and economizer w/ comparative enthalpy, low leak dampers, 2" throwaway rack less filters, terminal blank connection, Air Cooled Copper Condenser coil, high cap evap with galvanized drain pan, suction service valves, hot gas reheat, 0-5V GBAS, dual setpoint with Manual/Auto Changeover, cULus approval, Dual side access, and belt guards.
The service digit for each model number contains 38 digits; all 38 digits must be referenced.

Standard Unit Minimum Outside Air Temperature for Mechanical Cooling					
Without Hot Gas Bypass	40	40	40	40	40
With Hot Gas Bypass	55	55	55	55	55
Low Unit Minimum Outside Air Temperature for Mechanical Cooling					
Without Hot Gas Bypass	0	0	0	0	0
With Hot Gas Bypass	10	10	10	10	10
Evaporative Condenser Minimum Outside Temperature for Mechanical Cooling					
Without Sump Heater	40	40	40	40	40
With Sump Heater	10	10	10	10	10

Note: Air-Cooled/Evaporative Condensers - please note that not all data applies to both models.

(a) Heating Performance is AHRI and DOE certified
(b) Standard airflow applications of cooling only units require High Efficiency Throwaway Prefilters with the 90-95% Low PD Cartridge Filter Option.
(c) Standard airflow applications of cooling only units include 2" High Efficiency Throwaway Prefilters with the 90-95% Bag and HEPA Filter Options.
(d) Gas/Electric Units require 2" High Efficiency High Temperature Rated Throwaway Prefilters with High Temperature Rated 90-95% Cartridge and HEPA filter options.

Table 7. Gas heat inputs/input ranges/inlet sizes

Two-Stage Gas Heat				
Standard Gas Heat Input (MBh)	**Low Gas Heat Inputs (MBh)**	**High Fire Heat Input (MBh)**	**Modulating Gas Heat Range (MBh)**	**Gas Heat Inlet Sizes (in.)**

Notes:

1. Actual limits may be + or - the values shown; to accurately calculate capacities, contact the local Trane Sales Office or utilize TOPSS.
2. Follow the supply CFM ranges posted in the General Data for each case size.
3. All heaters are 80% efficient.
4. CFM values below the minimum and above the maximum shown in this table are not cULus approved.
5. Air temperature rise = heat output (Btu) ÷ (CFM x 1.085).

Table 59. Electric heat air temperature rise (60 Hz) — air-cooled and evaporative-condensing

Nominal Tons (AC/EC)	KW Input (60 Hz)	Total (MBh)	CFM									
			20000	22000	26000	30000	34000	38000	42000	46000	54000	58000

	58000		0	16.7	19	20.37	21.28	0	12.32	14.37	15.44	16.03

Notes:

1. Nominal capacity is in tons
2. WPD is waterside pressure drop in feet of water
3. Hot water capacity is at 180°F entering water temperature and 65°F entering air temperature
4. Maximum entering water temperature is 200°F.

Table 63. Steam coil heating capacities (Q/ITD) — air-cooled and evaporative-condensing

Nominal Tons (AC/EC)	Airflow	High Cap	Low Cap

	55000	14.52	10.01
	58000	14.84	10.18
150/162	23000	9.82	6.78
	26000	10.41	7.24
	30000	11.12	7.79
	35000	11.93	8.38
	40000	12.66	8.88
	45000	13.32	9.31
	50000	13.94	9.68
	55000	14.52	10.01
	58000	14.84	10.18

Notes:

1. Nominal capacity is in tons.
2. Steam coil capacity is at 15 psig and 65°F entering air temperature.
3. Capacities are expressed as mbh (Q) per degree (°F) of initial temperature difference (ITD) between the entering steam temperature (°F) and the entering (return) air temperature (°F) to the coil.
4. The maximum recommended steam pressure is 35 psig.

Table 64. Properties of steam

Steam Pressure (psig)	2	5	10	15	20	25	30	40	50
Temperature of Steam (°F)	219	227	239	250	259	267	274	287	298

Component Static Pressure Drops

Electrical Data

Electrical Service Sizing

To correctly size electrical service wiring for a unit, find the appropriate calculations listed below. Each type of unit has its own set of calculations for MCA (Minimum Circuit Ampacity), MOP (Maximum Overcurrent Protection), and RDE (Recommended Dual Element fuse size). Read the load definitions that follow and then find the appropriate set of calculations based on unit type.

Note: *Set 1 is for cooling only and cooling with gas heat units, and set 2 is for cooling with electric heat units.*

Load Definitions: (To determine load values, see the Electrical Service Sizing Data Tables on the following page.)

LOAD1 = Current of the largest motor (compressor or fan motor)

LOAD2 = Sum of the currents of all remaining motors

LOAD3 = Current of electric heaters

LOAD4 = Any other load rated at 1 AMP or more

Set 1: Cooling Only Rooftop Units and Cooling with Gas Heat Rooftop Units

MCA = (1.25 x LOAD1) + LOAD2 +LOAD4

MOP = (2.25 x LOAD1) + LOAD2 +LOAD4

Select a fuse rating equal to the MOP value. If the MOP value does not equal a standard fuse size as listed in NEC 240-6, select the next lower standard fuse rating.

Note: *If selected MOP is less than the MCA, then select the lowest standard maximum fuse size which is equal to or larger than the MCA, provided the selected fuse size does not exceed 800 amps.*

RDE = (1.5 x LOAD1) + LOAD2 + LOAD4

Select a fuse rating equal to the RDE value. If the RDE value does not equal a standard fuse size as listed in NEC 240-6, select the next higher standard fuse rating.

Note: *If the selected RDE is greater than the selected MOP value, then select the RDE value to equal the MOP value.*

Set 2: Rooftop units with Electric Heat

To arrive at the correct MCA, MOP, and RDE values for these units, two sets of calculations must be performed. First calculate the MCA, MOP, and RDE values as if the unit was in cooling mode (use the equations given in Set 1). Then calculate the MCA, MOP, and RDE values as if the unit were in the heating mode as follows. (Keep in mind when determining LOADS that the compressors don't run while the unit is in the heating mode).

MCA = 1.25 x (LOAD1 + LOAD2 + LOAD4) + LOAD3

The nameplate MCA value will be the larger of the cooling mode MCA value or the heating mode MCA value calculated above.

MOP = (2.25 x LOAD1) + LOAD2 + LOAD3 + LOAD4

The selection MOP value will be the larger of the cooling mode MOP value or the heating mode MOP value calculated above.

Select a fuse rating equal to the MOP value. If the MOP value does not equal a standard fuse size as listed in NEC 240-6, select the next lower standard fuse rating.

Note: *If selected MOP is less than the MCA, then select the lowest standard maximum fuse size which is equal to or larger than the MCA, provided the selected fuse size does not exceed 800 amps.*

RDE = (1.5 x LOAD1) + LOAD2 + LOAD3 + LOAD4

The selection RDE value will be the larger of the cooling mode RDE value or the heating mode RDE value calculated above.

Select a fuse rating equal to the RDE value. If the RDE value does not equal a standard fuse size as listed in NEC 240-6, select the next higher standard fuse rating.

Notes:

- *If the selected RDE is greater than the selected MOP value, then select the RDE value to equal the MOP value.*
- *On 90 to 162 ton rooftops, the selected MOP value is stamped in the MOP field on the unit nameplate.*

***Note**: The dimensions are the same for both the sensor and the receiver.*

Weights

Table 108. Approximate operating weights (lbs.)

Air-Cooled Units			Evaporative Condensing Units		
Nominal Tons	Unit (Minimum)	Roof Curb (Minimum)	Nominal Tons	Unit (Minimum)	Roof Curb (Minimum)
90	13731	907	100	18430	1055
105	14792	907	118	18941	1055
120	16939	1040	128	21362	1194
130	17241	1040	140	21348	1194
150	17923	1040	162	21470	1194

Notes:

1. Weights shown for air-cooled units include the following features: standard coils, 0-25% Outside Air, throwaway filters, low CFM supply fan, minimum motor sizes, constant volume, 460 XL, No heat. Weights shown for Evaporative-condensing units include high-capacity evaporator coil and the weight of the extra structure associated with a two piece unit. Add 1300 lbs for installed sump base water weight for evaporative condenser total operating weight.
2. Weights shown represent approximate minimum operating weights. To calculate weight for a specific unit configuration, utilize TOPSS or contact the local Trane sales representative. Weight outputs have a + 10% accuracy. ACTUAL WEIGHTS ARE STAMPED ON THE UNIT NAMEPLATE.

Mechanical Specifications

General

Units shall be specifically designed for outdoor rooftop installation on a roof curb and be completely factory assembled and tested, piped, internally wired, fully charged with compressor oil and shipped in one, two or three-pieces for field reassembly into a single unit. Single piece units shall be fully charged.

Units shall be available for direct expansion cooling only, or direct expansion cooling with natural gas, electric, hot water or steam heating. Filters, outside air system, exhaust air system, optional non-fused disconnect switches and all operating and safety controls shall be furnished factory installed.

All units shall be cULus approved and factory run tested. Select configurations shall also be compliant with IBC Seismic requirements. In select configurations, cooling capacity shall be tested in accordance with AHRI Standard 360. All units shall have decals and tags to aid in service and indicate caution areas. Electrical diagrams shall be printed on long life water resistant material and shall ship attached to control panel doors.

Casing

Exterior panels shall be zinc coated galvanized steel, phosphatized and painted with a slate grey air-dry finish durable enough to withstand a minimum of 672 hours consecutive salt spray application in accordance with standard ASTM B117. Screws shall be magnigard coated.

Refrigeration components and compressor shall be accessible through removable louvered panels as standard. Unit air handling section shall be laminated double-wall construction with polyurethane foam core injected between sheet metal panels and liners. Insulation value shall be R8. All interior surfaces shall be suitable for cleaning per ASHRAE 62. All access doors and panels shall have neoprene gaskets. Unit base shall be watertight with heavy gauge formed load bearing members and curb overhang. Unit lifting lugs shall accept chains or cables for rigging. Lifting lugs shall also serve as unit tie down points.

Access Doors

Access doors shall be hinged with a single, exterior mounted, height and tension adjustable, handle to provide positive latching at three points. Access doors shall provide a door stop mechanism to latch the door in the open position to prevent unsafe door closure by wind.

Doors of laminated double wall construction with a polyurethane foam core between the exterior sheet metal pane and the interior liner, with an insulating value of R8 shall be provided on the air handlers serviceable compartments such as return/exhaust fan, filters, evaporator coil, and blank sections. Two single wall doors shall be provided for access to the control panel.

Blank Sections

A four or eight foot blank section of laminated double wall construction with a polyurethane foam core between the exterior sheet metal panel and the interior liner, with an insulating value of R8 shall be provided with similarly built, hinged, access doors on either side

Two- or Three-Piece Construction

In order to facilitate lifting and rigging a two- or three-piece option is available. The condenser section contains the refrigerant charge and associated valving to make recoupling the unit on the roof curb easy. An electrical box is provided on the condenser to seamlessly and quickly reconnect the electrical power and control systems. Transition panels are provided for the integrity on the recoupled unit.

Note: *Multi-piece units are shipped with nitrogen and must be field charged with R-410A.*

Airflow Path

Unit shall have downflow discharge conditioned air path or horizontal discharge. Return airflow path shall be either upflow or horizontal through the side or the end.

Burglar Bars

A grate system shall be installed in supply and return air duct connection areas on non-horizontal airflow path units to minimize unwanted intrusion into duct systems.

Belt Guard

Supply and exhaust fans shall have a universal size belt guard to accommodate any applicable drive configuration. The guard totally encloses the drive system and is provided with a two-piece removable front panel for servicing. Return fan guards shall be individually sized with a single piece removable panel for servicing.

Refrigeration System

Compressors

Compressors shall be direct-drive, hermetic, scroll-type compressors with centrifugal-type oil pumps. Each compressor has a crankcase heater to minimize the amount of liquid refrigerant present in the oil sump during off cycles. Discharge line service valves are standard on each refrigerant circuit, as well as liquid moisture indicator/sight glass.

eFlex™ Variable Speed Compressors

The Trane eFlex™ variable speed compressor shall be capable of speed modulation from 25 Hz to a maximum of 100 Hz. The minimum unit capacity shall be 15% of full load or less. The compressor motor shall be a permanent magnet type. Each compressor shall have a crankcase heater installed, properly sized to minimize the amount of liquid refrigerant present in the oil sump during off cycles. Compressors shall be equipped with a bearing oil injection system that optimizes scroll set lubrication, sealing, and controls the oil circulation rate.

Optimal bearing lubrication shall be provided by a gerotor oil pump. Each variable speed compressor shall be matched with a specially designed variable frequency drive which modulates the speed of the compressor motor and provides several compressor protection functions. Control of the variable speed compressor and inverter control shall be integrated with the IntelliPak unit controller to ensure optimal equipment reliability and efficiency.

Supply Fan

Standard or low airflow supply fan shall have a single fan assembly with double width, double inlet, airfoil fan, motor and fixed pitch sheave drive. All fans shall be statically and dynamically balanced for the operating envelop. It shall be tested in the factory. Supply fans shall be test run in unit as part of the unit test. Fan operating envelop rpm shall be below first critical speed. Fan shafts shall be mounted on two grease lubricated ball bearings designed for 200,000 hours average life.

Extended grease lines shall allow greasing of bearings from section base rail. Fan motor and fan assembly shall be mounted on common base to allow consistent belt tension with no relative motion between fan and motor shafts. Entire assemblies shall be completely isolated from unit by two-inch deflection spring isolators.

Evaporator Coil

Internally enhanced copper tubing of ½-inch O.D. shall be mechanically bonded to heavy-duty aluminum fins of configured design. All coils shall be equipped with thermal expansion valves and factory pressure and leak tested. A double sloped galvanized or stainless steel drain pan shall be provided to drain condensate to both sides of the unit.

Stainless Steel Drain Pans

In order to enhance longevity and cleaning ease, optional Stainless Steel Drain Pans are available under the evaporator coil area.

Hot Gas Bypass

The hot gas bypass option shall consist of valves, piping and controls that are all included on circuit 2 to allow operation at low airflow, avoiding coil frosting and damage to compressor. When suction pressure falls below valve adjustable setpoint, the valves modulate hot gas to the inlet of the evaporator.

Filter Drier

Removable core filter driers shall be optionally available and installed on each refrigeration circuit. For easy access, the filter driers are conveniently located in the condenser section close to the periphery of the unit.

Suction Service Valves

Each compressor shall be optionally equipped with a suction service valve in order to facilitate compressor servicing.

Air-Cooled Condensing

Air-Cooled Condensing

Condenser coils shall have all-aluminum, Microchannel coils. All coils shall be leak tested at the factory to ensure pressure integrity. The condenser coil is pressure tested to 650 psig. Subcooling circuit(s) shall be provided as standard.

Air-Cooled Condenser Fans and Motors

All condenser fans shall be vertical discharge, direct drive fans, statically balanced, with steel blades and zinc plated steel hubs. Condenser fan motors shall be totally enclosed three-phase motors with permanently lubricated ball bearings, built-in current and thermal overload protection and weather tight slingers over motor bearings.

Corrosion Protected Condenser Coil

All aluminum Microchannel condenser coil protection shall consist of a corrosion resistant coating that shall withstand ASTM B117 Salt Spray test for 6,000 hours and ASTM G85 A2 Cyclic Acidified Salt Fog test for 2,400 hours. This coating shall be added after coil construction covering all tubes, headers and fin edges, therefore providing optimum protection in more corrosive environments.

Evaporative Condensing

Evaporative Condensing-Housing

The water basin, corner posts and roof shall be constructed with 304 Stainless Steel. Water basin shall be lined with FRP coating to make it watertight. The side panels and sliding access doors shall be constructed of corrosion and UV resistant, low density fiber glass. Housing shall also have 4 lifting holes, one in each corner to handle the unit with crane.

Evaporative Condensing - Condenser Coils

Durable copper 5/16" OD, 0.022 wall thickness serpentine tubing provides strength and resilience for expansion.

Evaporative Condensing - Condenser Fan

The fan motors have variable speed capability which shall be controlled by factory-installed unit controller.

Evaporative Condensing - Pump

Minimal maintenance sump pump is fully accessible through the evaporative-condenser access panel. Water is pumped at min 80 GPM. The pump shall be powered by 460 V / 3 Phase.

Evaporative Condensing- Sump Float Level Switch

The minimum level float switch shall protect the pump from running dry by turning the fill valve ON and allowing the sump to fill to a predefined minimum level. The maximum level float switch shall prevent the overfilling of the sump and water wastage by turning the fill valve OFF when a predefined maximum level is reached in the sump. Minimum and maximum float switched shall be permanently affixed to the water basin and shall not need any field adjustment.

Water Treatment

To simplify field installation, unit shall have hookups for water treatment devices. Water treatment by a water treatment expert is required for all evaporative condenser units to ensure proper equipment life, product performance and operation. If a Dolphin WaterCare System is used water must be maintained by a water treatment professional throughout the unit life of the Air Handling System.

Dolphin WaterCare System

The Dolphin WaterCare System focuses on minimizing scale build up and managing biological agents with no chemicals. An electronic signal is sent through a PVC pipe at a constant rate, inducing electromagnetic fields. The electromagnetic fields interact with colloidal particles causing precipitation, which does not adhere to the pipe, and is removed through the sump purge. Bacteria and corrosion in the water system is controlled and kept to minimal levels by their incorporation into the precipitate and low frequency radiation generated through the electronic pulsing.

Controls

Unit shall be completely factory wired with necessary control and contactor pressure lugs or terminal block for power wiring. Units shall provide an internal location for a non-fused disconnect with external handle for safety. Unit mounted microprocessor controls shall provide anti-short cycle timing for compressors to provide a high level of machine protection.

Unit Controller

DDC microprocessor controls shall be provided to control all unit functions. The control system shall be suitable to control CV or VAV applications. The controls shall be factory installed and mounted in the main control panel. All factory installed controls shall be fully commissioned (run tested) at the factory. The unit shall have a Human Interface Panel with a 16 key keypad, a 2 line X 40 character clear English display as standard to provide the operator with full adjustment and display of control data functions. The unit controls shall be used as a stand-alone controller, or as part of a building management system involving multiple units.

- The unit shall be equipped with a complete microprocessor control system. This system shall consist of temperature and pressure (thermistor and transducer) sensors, printed circuit boards (modules), and a unit mounted Human Interface Panel. Modules (boards) shall be individually replaceable for ease of service. All microprocessors, boards and sensors shall be factory mounted, wired and tested. The microprocessor boards shall be standalone DDC controls not dependent on communications with an on-site PC or a Building Management Network. The microprocessors shall be equipped with onboard diagnostics, indicating that all hardware, software and interconnected wiring are in proper operating condition. The modules (boards) shall be protected to prevent RFI and voltage transients from affecting the board circuits. All field wiring shall be terminated at separate, clearly marked terminal strip. Direct field wiring to the I/O boards is not acceptable. The microprocessor's memory shall be non-volatile EEPROM type requiring no battery or capacitive backup, while maintaining all data.
- Zone sensors shall be available in several combinations with selectable features depending on sensor.

- The Human Interface Panel keypad display character format shall be 40 characters x 2 lines. The character font shall be 5 x 7 dot matrix plus cursor. The display shall be Supertwist Liquid Crystal Display (LCD) with blue characters on a gray/green background which provides high visibility and ease of interface. The display format shall be in clear English.
- The keypad shall be equipped with 16 individual touch-sensitive membrane key switches. The switches shall be divided into four separate sections and be password protected from change by unauthorized personnel. The six main menus shall be STATUS, SETPOINTS, DIAGNOSTICS, SETUP, CONFIGURATION and SERVICE MODE.
- Microprocessor control system shall provide Loss of Refrigerant Charge diagnostics to warn of a slightly undercharged situation followed by a warning and a lock out of an undercharged circuit for overall unit performance and compressor protection.
- The Human Interface Panel shall provide refrigerant superheat reading for each circuit to assist the service technician in troubleshooting.

Control Options

Remote Human Interface Panel

Remote Human Interface Panel (RHI) option can perform all the same functions as unit mounted Human Interface Panel, except for the Service Mode. Up to 4 rooftop units can be monitored and controlled with a single RHI Panel. This panel uses the same attractive enclosure as the Tracker building control panel. With features such as a 2 line X 40 character clear English display, a red LED light to indicate an alarm condition (alarm also shown on the two line display), a simple 16 key keypad that is used in conjunction with the display to prompt the infrequent user when making desired changes and an attractive hinged door makes the RHI very suitable for mounting on any wall. The RHI can be mounted inside a building, up to 5000 feet from the unit. The RHI is wired to the IPCB mounted in the rooftop with twisted wire pair communication wiring and 24V control wiring.

Trane LonTalk® Communication Interface Module (LCI-I)

The LCI-I shall provide an interface to a Tracer Summit™ building automation system or other control system that supports LonTalk® and shall be factory installed, allowing for control and monitoring of the unit through a RS485, two-wire communication link.

Trane BACnet® Communication Interface Module (BCI-I)

The BCI-I shall provide an interface to Tracer® SC or a 3rd party control system that supports BACnet® and shall be factory or field installed, allowing for control and monitoring of the unit through a RS485, two-wire communication link.

AirFi™ Wireless Communication Interface - Field Installed

Trane AirFi™ Wireless Communication interface shall provide wireless communication between the Tracer SC, Tracer Unit Controllers and BACnet Communication Interface (BCI) modules.

Low Ambient Unit Operation-Variable Frequency Drives VFDs

The low ambient option shall allow the unit to operate down to 0°F. The VFDs shall be located in an enclosure inside the service side corner post that is adjacent to the main control box. The VFD keypads and displays shall be accessible through a standard door that will allow "touch-safe" access to the VFDs. VFD protection fuses shall be accessible through a second door below the VFD access door.

Low Ambient Unit Operation-575 Volt Units

The low ambient option shall allow the unit to operate down to 0°F. Units configured with a 575V power requirement and low ambient unit operation shaill require the use of step-down transformers. Additional 3-phase transformers and transformer fuses shall be required to step the voltage down to a 460V operating voltage. The VFDs and the condenser fan motors controlled by the VFDs shall be 460V operating devices

Generic Building Automation System Module (GBAS 0-5 VDC)

Option shall be provided for those cases where non-Tracer building management system is used. The GBAS module option shall provide a binary input for Demand Limiting, four (4) analog inputs for setpoint adjustment and five (5) relay outputs for diagnostic reporting. Inputs shall use a potentiometer or 0-5 VDC signal.

Generic Building Automation System Module (GBAS 0-10 VDC)

Option shall be used to provide broad control capabilities for building automation systems other than Trane's Tracer system. The GBAS module shall provide a binary input for Demand Limiting, four (4) analog inputs for setpoint adjustment and four (4) analog outputs as well as one (1) relay output for diagnostic reporting. Inputs can use a potentiometer or 0-10 VDC signal.

Inter-Processor Communication Bridge (IPCB)

This optional module shall provide an amplified and filtered version of the IPC link for connection to a Remote Human Interface Panel. Each rooftop that is tied into a Remote Human Interface Panel shall have an IPCB installed into it.

Rapid Restart

Option shall provide immediate start up upon power failure. A backup generator is required on site before unit start up. Rapid Restart will begin immediately after recovery from a power loss and work by restarting the compressors and supply fan quickly to provide full cooling within two to three minutes.

System Control Options

Constant Volume (CV)

Provided with all the necessary controls to operate rooftop from a zone sensor, including CV microprocessor unit control module, a microprocessor compressor controller and a unit mounted Human Interface Panel.

Variable Air Volume (VAV) Supply Air Temperature control

Option shall provide all the necessary controls to operate a VAV rooftop from the discharge air temperature, including discharge air microprocessor controller and discharge air sensor. The microprocessor controller shall coordinate the economizer control and the stages of cooling with zone or outdoor air reset capabilities and an adjustable control band to fine-tune the control to specific applications.

VAV Supply Air Temperature Control with Variable Frequency Drives w/ or w/o Bypass

Option shall provide all necessary controls to operate a VAV rooftop from the discharge air temperature, including discharge air microprocessor controller and discharge air sensor. The microprocessor controller shall coordinate the economizer control and the stages of cooling with discharge air temperature reset capabilities. Includes factory installed and tested VFDs to provide supply fan motor speed modulation. VFD receives 0-10 VDC from the unit microprocessor based upon supply static pressure and causes the drive to accelerate or decelerate as required to maintain the supply static pressure setpoint. Optional bypass control shall provide full nominal airflow in the event of drive failure.

Single Zone Variable Air Volume

Single zone VAV option shall be provided with all necessary controls to operate a rooftop unit based on maintaining two temperature setpoints; the discharge air and zone. Option shall include factory-installed variable frequency drive (VFD) to provide supply fan motor speed modulation. During One Zone VAV cooling, the unit will maintain zone cooling setpoint by modulating the supply fan speed more or less to meet zone load demand, and the unit will maintain discharge temperature to the discharge cooling setpoint by modulating economizer if available and staging dx cooling.

Electrical System

Power Supply

Air-cooled rooftops shall be available with 460 or 575 voltage, 3 phase 60 hertz power supply and 380 voltage, 3 phase 50 hertz power supply (Evaporative Condenser models available in 460 voltage, 3 phase, 60 hertz power supply only).

Convenience Outlet

A 15A, 115V Ground Fault Interrupter convenience outlet shall be factory installed and wired and powered from a factory mounted transformer. A unit mounted, non-fused disconnect with internal handle is furnished with the factory powered convenience outlet.

Non-Fused Disconnect Switch

An external handle mounted on the control box door shall be provided to disconnect unit power with the control box door closed for safety.

Compressor Protection

Compressor Protection Modules shall be included in the junction box to protect compressors against reverse rotation.

Unit Interrupt Rating (Short Circuit Current Rating-SCCR)

An optional 65,000 Amp rating (480V) and 25,000 Amp rating (600V) shall be applied to the unit enclosure using a non-fused circuit breaker for disconnect switch purposes. Fan motors, compressors, and electric heat circuits shall be provided with series rated circuit breakers that will provide the unit rated level of protection. The unit shall be marked with approved cULus markings and will adhere to cULus regulations.

Marine Lights (Customer Powered)

A 120V master light switch shall be factory installed in the main unit control box for lighting control. The master switch shall be wired into an isolated terminal block with access for customer provided service. Marine light fixtures shall be supplied with 150W incandescent bulbs. Marine light fixtures shall be placed in the Supply Section (2), Outside Air Section (1), Return Section (1), and Extended Casing Section (1) for units without Heat.

Supply/Exhaust/Return Motors

Supply, exhaust/return motors shall be either open drip-proof or totally enclosed fan cooled (TEFC). All 60 Hz motors meet the Energy Independence and Security Act of 2007 (EISA). All 50 Hz supply, exhaust/ return motors shall meet the U.S. Energy Policy Act of 1992 (EPACT). Motors with internal Shaft grounding rings can be selected for use with VFD applications to provide a conductive discharge path away from the motor bearings to ground.

Filters

General

Filter options shall mount integral within the unit and be accessible by a hinged access door with a single point latching device.

Pre-evaporator Coil Filter Options

No Filters (Two-inch Nominal Thickness Throwaway Filter Rack Only)

Shall provide a galvanized steel filter rack (less filter media) with filter channels to handle a complete set of two-inch nominal thickness throwaway filters to accommodate applications which require field supplied filters.

No Filters (Bag or Cartridge Filter Rack with Throwaway Prefilter Rack Only)

Shall provide a galvanized steel filter rack (less filter media) to handle a complete set of two-inch or four-inch (depending on airflow) nominal thickness throwaway prefilters and 7/8" actual header thickness bag or cartridge filters to accommodate applications which require field supplied filters.

MERV 8 Throwaway Filters (Standard)

Shall be provided as standard-U.L. Class 2, two-inch nominal thickness, high efficiency pleated media filters rated MERV 8 per ASHRAE 52.2. Filters shall be provided mounted in a galvanized steel filter rack.

MERV 15, 90-95 Percent Bag Filters Option

Nineteen-inch deep bag filters shall be U.L. Class 2 and have synthetic media mounted to a 7/8" nominal thickness header frame. These bag filters shall have an efficiency rating of MERV 15 per ASHRAE 52.2. To ensure maximum bag filter life two-inch prefilters shall be included with the bag filters. Filters shall be mounted in a galvanized steel filter rack.

MERV 14, 90-95 Percent Cartridge Filters Option

Twelve-inch deep cartridge filters shall be U.L. Class 1 and be mounted with a 7/8" nominal thickness header frame. These cartridge filters shall have an efficiency rating of MERV 14 per ASHRAE 52.2. To ensure maximum cartridge filter life, two-inch (or four-inch, depending on the application) prefilters shall be included with the cartridge filters. Filters shall be mounted in a galvanized steel filter rack.

MERV 14, 90-95 Percent, Low Pressure Drop, Totally Incinerable, Cartridge

Twelve-inch deep cartridge filter shall be U.L. Class 2 and mounted with a rigid 7/8" nominal thickness header frame. These low pressure drop cartridge filters shall have an efficiency rating of MERV 14 per ASHRAE 52.2. To ensure maximum cartridge filter life two-inch or four-inch prefilters (depending on airflow) shall be included with the high-flow, cartridge filters. Filters shall be mounted in a galvanized steel filter rack.

Final Filters Options (Available Only on Units with Blank Section)

Final filter section filter options shall mount integral within the blank section unit casing and be accessible by hinged access doors.

MERV 15, 90-95 Percent, Bag, Final Filter Option

Note: *Available on cooling only units with four or eight-foot blank section, as well as steam and hot water units with eight-foot blank section, unit casing only.*

Nineteen-inch deep bag filters shall be U.L. Class 2 and have synthetic media mounted to a 7/8" nominal thickness header frame. These bag filters shall have an efficiency rating of MERV 15 per ASHRAE 52.2. To ensure maximum bag final filter life two-inch, MERV 8 prefilters shall be included with the bag filters. Filters shall be mounted in a galvanized steel filter frame bank.

MERV 14, 90-95 Percent, Cartridge, Final Filter Option

Note: *Available on cooling only units with four or eight-foot blank section, as well as steam and hot water units with eight-foot blank section, unit casing only.*

Twelve-inch deep cartridge filters shall be U.L. Class 1 and be mounted with a 7/8" nominal thickness header frame. These cartridge filters shall have an efficiency rating of MERV 14 per ASHRAE 52.2. To ensure maximum cartridge filter life, two-inch, MERV 8 prefilters shall be included with the cartridge filters. Filters shall be mounted in a galvanized steel filter frame bank.

MERV 14, 90-95 Percent, Low Pressure Drop, Totally Incinerable, Cartridge

Note: *Available on cooling only units with four or eight-foot blank section, as well as steam and hot water units with eight-foot blank section, unit casing only.*

Twelve-inch deep cartridge filter shall be U.L. Class 2 and mounted with a rigid 7/8" nominal thickness header frame. These cartridge filters shall have an efficiency rating of MERV 14 per ASHRAE 52.2. To ensure maximum cartridge final filter life four-inch, MERV 8 prefilters shall be included with these cartridge filters. Filters shall be mounted in a galvanized steel filter frame bank.

MERV 14, 90-95 Percent, High Temperature Rated, Cartridge, Final Filter Option

Note: *Available on gas and electric heat units with eight-foot blank section casing only.*

Twelve-inch deep cartridge filters shall be U.L. Class 1 and be mounted in a galvanized steel casing with a 7/8" nominal thickness header frame. These cartridge filters shall have an efficiency rating of MERV 14 per ASHRAE 52.2. To ensure maximum cartridge final filter life high temperature rated two-inch, MERV 8 prefilters shall be included with the cartridge filters. Filters shall be mounted in a galvanized steel filter frame bank.

MERV 17, 99.97 Percent, Standard Temperature Rated, HEPA, Final Filter Option

Note: *Available on cooling only units with four or eight-foot blank section, as well as steam and hot water units with eight-foot blank section, unit casing only.*

Twelve-inch deep HEPA filters shall be U.L. Class 1 and be mounted in a galvanized steel casing. These filters have an efficiency rating of MERV 17 per ASHRAE 52.2 and an efficiency of 99.97% on a 0.3 micron DOP particle size. To ensure maximum HEPA final filter life two-inch, MERV 8 prefilters shall be included with the HEPA final filters. Filters shall be mounted in a galvanized steel filter frame bank.

MERV 17, 99.97 Percent, High Temperature Rated, HEPA, Final Filter Option

Note: *Available on gas and electric heat units with eight-foot blank section casing only.*

Twelve-inch deep HEPA filters shall be U.L. Class 1 and be mounted in a galvanized steel casing. These filters have an efficiency rating of MERV 17 per ASHRAE 52.2 and an efficiency of 99.97% on a 0.3 micron DOP particle size. To ensure maximum HEPA final filter life high temperature rated two-inch, MERV 8 prefilters shall be included with the HEPA final filters. Filters shall be mounted in a galvanized steel filter frame bank.

Exhaust Air

General

Exhaust air options shall include no relief, 100 percent modulating exhaust fan and 100 percent modulating exhaust fan with direct space building pressurization control. Exhaust fans shall be either standard or low airflow

No Relief (Standard)

Relief air opening shall be sealed with panel and made watertight.

100 Percent Modulating Exhaust Fan Option

Fan design shall be double width, double inlet forward-curved type. Fan shall be mounted on a shaft with fixed sheave drive. All fans shall be dynamically balanced and tested in factory before being installed in unit. It shall be test run in unit as part of unit test.

Fan operating envelop rpm shall be below first critical speed. Fan shaft shall be mounted on two grease lubricated ball or roller bearings as applicable designed for 200,000-hour average life. Extended grease lines shall be provided to allow greasing of bearings from section base rail. Fan motor and assembly shall be mounted on common base to allow consistent belt tension with no relative motion between fan and motor shafts. The entire assembly shall be completely isolated from unit with 2-inch spring isolation. Discharge dampers at unit outlet shall modulate exhaust airflow in response to OA damper position.

The fan shall operate when economizer damper is open greater than minimum position. Discharge dampers at fan outlet shall modulate in response to economizer damper position on Constant Volume (CV) rooftops.

100 Percent Modulating Exhaust Fan with Statitrac Control Option

Fan design shall be double width, double inlet forward-curved type. Fan shall be mounted on a shaft with fixed sheave drive. All fans shall be dynamically balanced and tested in factory before being installed in unit. Exhaust fan shall be test run as part of unit final run test.

Fan operating envelop rpm shall be below first critical speed. Fan shaft shall be mounted on two grease lubricated ball or roller bearings designed for 200,000-hour average life. Extended grease lines shall be provided to allow greasing of bearings from section base rail.

Fan motor and assembly shall be mounted on common base to allow consistent belt tension with no relative motion between fan and motor shafts. The entire assembly shall be completely isolated from unit with 2-inch spring isolators. For both CV and VAV rooftops, the 100 percent modulating exhaust discharge damper (or VFD) shall be modulated in response to building pressure. A differential pressure control system, (Statitrac), shall use a differential pressure transducer to compare indoor building pressure to outdoor ambient atmospheric pressure. The FC exhaust fan shall be turned on when required to lower building static pressure setpoint.

The (Statitrac) control system shall then modulate the discharge dampers (or VFD) to control the building pressure to within the adjustable, specified deadband that shall be adjustable at the Human Interface Panel. Optional bypass can be factory installed to provide full nominal airflow in the event of a drive failure.

Return Air

General

Return air options shall include 100 percent modulating return fan and 100 percent modulating return with direct space building pressurization control. Return fans shall be either standard or low airflow.

100 Percent Modulating Return Fan

A single width plenum fan with airfoil blade shall be mounted on a shaft with fixed sheave drive. The fan shall be dynamically balanced for the operating envelop and tested in factory before being installed in unit. The plenum fan shall be test run in unit as part of unit test. Fan operating envelop rpm shall be below first critical speed. Fan shaft shall be mounted on two grease lubricated ball or roller bearings designed for 200,000-hour average life. Extended grease lines shall be provided to allow greasing of bearings from section base rail.

Fan motor and assembly shall be mounted on common base to allow consistent belt tension with no relative motion between fan and motor shafts. The entire assembly shall be completely isolated from unit with 2-inch spring isolators. Discharge dampers at unit outlet shall modulate relief airflow in response to OA / return air damper position. The return fan VFD shall operate in conjunction with the supply fan.

100 Percent Modulating Return Fan with Statitrac Control Option

A single width plenum fan with airfoil blade shall be mounted on a shaft with fixed sheave drive. The fan shall be dynamically balanced for the operating envelop and tested in factory before being installed in unit. The plenum fan shall be test run as part of unit final run test. Fan operating envelop rpm shall be below first critical speed. Fan shaft shall be mounted on two grease lubricated ball or roller bearings designed for 200,000-hour average life. Extended grease lines shall be provided to allow greasing of bearings from section base rail.

Fan motor and assembly shall be mounted on common base to allow consistent belt tension with no relative motion between fan and motor shafts. The entire assembly shall be completely isolated from unit with 2-inch spring isolators. The 100 percent modulating relief damper shall be modulated in response to building pressure. A differential pressure control system, (Statitrac), shall use a differential pressure transducer to compare indoor building pressure to outdoor ambient atmospheric pressure.

The Statitrac control system shall modulate the discharge dampers to control the building pressure to within the adjustable, specified deadband that shall be adjustable at the Human Interface Panel. The return fan VFD shall modulate in response to return duct static pressure. Optional bypass can be factory installed to provide full nominal airflow in the event of a drive failure.

Outside Air

General

Three outside air options: 0 to 25 percent motorized controlled outside air, 0-100 percent fully modulating economizer, and 0-100 percent fully modulating economizer with outside air measurement.

0-25 Percent Motorized Outside Air Damper Option

0-25 percent motorized outside air damper option shall include an outside air opening with moisture eliminator and motorized position damper for drawing up to 25 percent outside air. The damper position will be adjustable at the Human Interface Panel.

0-100 Percent Modulating Economizer Option

Operated through the primary temperature controls to automatically utilize OA for "free" cooling. Automatically modulated return and OA dampers shall maintain proper temperature in the conditioned space. Economizer shall be equipped with an automatic lockout when the outdoor high ambient temperature is too high for proper cooling. Minimum position control shall be standard and adjustable at the Human Interface Panel or with a remote potentiometer or through the building management system. A spring return motor shall ensure closure of OA dampers during unit shutdown or power interruption. Mechanical cooling shall be available to aid the economizer mode at any ambient. Standard economizer dampers shall have a leakage rate of 20 CFM/ft^2 at 1.0 in W.C. pressure difference.

Low Leak Dampers

Low leak dampers shall be provided with chlorinated polyvinyl chloride gasketing added to the damper blades and rolled stainless steel jamb seals to the sides of the damper assembly. The low leak dampers shall have a leakage rate of 10 CFM/ft^2 (AMCA Class 2) at 1.0 in W.C. pressure difference.

Ultra Low Leak Dampers AMCA Class 1

Standard ultra low leak damper will have added sealing under the jam seals and in the frame. The ultra low leak dampers shall have a leakage rate of 4 CFM/ft^2 (AMCA Class 1) at 1.0 in W.C. pressure difference.

Note: *Based on testing completed in accordance with AMCA Standard 500D.*

Ultra Low Leak, AMCA 1A Economizer

The AMCA 1A rated Ultra Low Leak Economizer option shall be provided with parallel operating, horizontal airfoil blades and spring-return actuators (to the fresh air closed, return air open position). The economizer, including linkages and actuators, shall have a 5 year limited warranty and functional life of 60,000 opening and closed cycles. Dampers shall be AMCA 511 Class 1A certified with a maximum leakage rate of 3 CFM/sq-ft at 1.0 in WC pressure differential.

Economizer frame and 6" wide blades shall be galvanized steel. Blade edge seals shall be Ruskiprene (-72°F to + 275°F) and jamb seals shall be compressible, flexible metal.

The economizer fresh air damper shall include an adjustable linkage to allow for field damper balance of pressure drop between 100% fresh and 100% return airflow paths. The adjustable linkage is used to limit the fresh air damper maximum wide open stroke.

Fault Detection and Diagnostic

Fault Detection and Diagnostic (FDD) control will also be provided with Ultra Low Leak Economizers. FDD control monitors the commanded position of the economizer compared to the feedback position of the damper. If the damper position is outside +/- 10% of the commanded position, a diagnostic is generated.

Intellipak units ordered with Ultra Low Leak Economizers will be listed on the California Energy Commission Registry for factory compliance with Title 24 Economizer and FDD requirements. A

label will be applied to the unit identifying construction with the Ultra Low Leak Economizer and FDD controls.

Economizer Control with Comparative Enthalpy

Used with the outside air economizer, two enthalpy sensors are provided to compare total heat content of the indoor air and outdoor air to determine the most efficient air source when economizing.

Economizer Control with Reference Enthalpy

Used with the outside air economizer, an outdoor enthalpy sensor is provided to compare the total heat content of outdoor air to a locally adjustable setpoint. The setpoint is programmed at the human interface, or remote human interface, to determine if the outdoor enthalpy condition is suitable for economizer operation.

Economizer Control with Dry Bulb

Used with the outside air economizer, an outdoor temperature sensor is included for comparing the outdoor dry bulb temperature to a locally adjustable temperature setpoint. The setpoint is programmed at the human interface, or remote human interface, to determine if outdoor air temperature is suitable for economizer operation.

Outside Air Measurement (Traq)

A factory mounted airflow measurement station (Traq) shall be provided in the outside air opening to measure airflow. The airflow measurement station shall be AMCA certified (+/- 5.0%) from 300fpm to 2500fpm. The airflow measurement station shall adjust for temperature variations

Demand Control Ventilation

When equipped with a CO_2 sensor and the (VCM) module, the outside air damper position shall modulate in response to a CO_2 sensor in the conditioned space, in order to minimize the unit energy consumption, yet simultaneously meet the ventilation requirements of ASHRAE Std 62.1. The Traq airflow monitoring solution augments the system, allowing for measurement and control of outside airflow.

Note: *CO_2 sensor used with Demand Control Ventilation must be powered from an external power source or separate 24 VAC transformer.*

Ventilation Override Module

With the optional Ventilation Override Module (VOM) installed, the unit shall be programmed to transition to up to 5 different programmed sequences for Smoke Purge, Evacuation, Pressurization, Purge, Purge with duct control sequence and Unit off. The transition shall occur when a binary input on the VOM is closed (shorted); this would typically be a hard wired relay output from a smoke detector or fire control panel.

Heating System

Electric Heating Option

All electric heat models shall be completely assembled and have wired electric heating system integral within the rooftop unit. Heavy duty nickel chromium elements internally wired with a maximum density of 40 watts per square inch shall be provided. Heater circuits shall be 48 amps or less, each individually fused. Automatic reset high limit control shall operate through heater backup contactors. The 460 and 575 volt electric units shall have optional factory mounted non-fused disconnect switch located in the main control panel to serve the entire unit.

Gas Fired Heating Option

All gas fired units shall be completely assembled and have a wired gas fired heating system integral within unit. Units shall be cULus approved specifically for outdoor applications

downstream from refrigerant cooling coils. All gas piping shall be threaded connection with a pipe cap provided. Gas supply connection shall be provided through the side on horizontal discharge units, and through the bottom and side for downflow discharge units. All units shall be fire tested prior to shipment.

- Heat Exchanger shall be tubular two pass design with stainless steel primary and secondary surfaces. Free floating design shall eliminate expansion and contraction stresses and noises. Gasketed cleanout plate shall be provided for cleaning of tubes/ turbulators. Heat exchanger shall be factory pressure and leak tested.
- Burner shall be a stainless steel industrial type with an air proving switch to prevent burner operation if the burner is open for maintenance or inspection. Ceramic cone shall be provided to shape the flame to prevent impingement on sides of heat exchanger drum. Burner assembly shall house ignition and monitoring electrode.
- Combustion Blower shall be centrifugal type fan to provide air required for combustion. Fan motor shall have built-in thermal overload protection.
- Gas Safety Controls shall include electronic flame safety controls to require proving of combustion air prior to ignition sequence which shall include a 60 second pre-purge cycle. Pilot ignition shall be provided on 850, 1100, 1800 and 2500 MBh heat exchanger units. Sixty second delay shall be provided between first and second stage gas valve operation on two-stage heaters. Continuous electronic flame supervision shall be provided as standard.
- Full Modulation Gas Heaters shall be made from grades of stainless steel suitable for condensing conditions. The heater shall have a turn down ratio of at least 10 to 1 on the 850 and 20 to 1 on the 1100, 1800 and 2500 MBh

Steam Heating Option

Steam coils shall be Type NS with non-freeze steam distribution circuits. Distributor tubes shall be located concentrically within condensing tubes to assure even steam distribution. Coils shall be pitched to provide complete drainage. Steam modulating valve with actuator shall be provided.

Hot Water Heating Option

Hot water coils shall be Type 5W and factory mounted in the rooftop unit to provide complete drainage of coil. Hot water modulating valve with actuator shall be provided.

Energy Saving Options

Energy Recovery Wheel

The energy recovery option improves humidity control while using energy that is normally exhausted from the space. The option shall incorporate a rotary wheel in an insulated cassette frame complete with seals, drive motor, and drive belt. Two wheel size options shall be available for each unit. The standard size option shall be capable of treating 50% of maximum unit outside airflow, while the low CFM shall be able to treat only 30%. An exhaust fan shall be required in conjunction with the energy recovery option. A return fan option is incompatible with the energy recovery wheel option.

A total energy recovery wheel is required to recover both sensible and latent energy. The factory installed wheel shall be coated with a silica gel desiccant. The desiccant shall be permanently bonded without the use of binders or adhesives or other means which may degrade desiccant performance. The substrate shall be lightweight polymer and shall not degrade nor require additional coatings for application in marine or coastal environments.

Desiccant shall not dissolve or deliquesce in the presence of water or high humidity. The coated wheel segments shall be washable with non-acid coil cleaner or alkaline detergent and warm water. Wheel segments shall be removable without specialized tools or compartment modifications to facilitate maintenance and cleaning.

Hot Gas Reheat Option

Hot Gas Reheat option shall consist of hot gas reheat coil, located on the leaving air side of the evaporator coil, and pre-piped to circuit 1 along with a modulating reheat valve.

Evaporative Condensing Option

The evaporative condenser module shall be located in the outdoor section of the unit. The module shall consist of two serpentine copper coils enclosed in a fiber glass and stainless steel cabinet, a sump to hold the water, and water and air movement devices. The water movement devices shall consist of a sump pump for water distribution on the coils, float switches to maintain the water level in the sump, fill and drain valves to fill and drain the sump as required. The air movement devices are condenser fans that are modulated to control air flow through the coils.

Accessories

Roof Mounting Curb

Roof mounting curb shall be heavy gauge zinc coated steel with nominal two-inch by four-inch nailer setup. Supply/return air opening gasketing shall be provided. Curb shall ship knocked down for easy assembly. Channel shall be provided to allow for adjustment of return air opening location. Curb shall be manufactured to National Roofing Contractors Association guidelines.

Electronic Zone Sensors

- Zone Sensor shall provide two temperature setpoint levers, Heat, Auto, Off, or Cool system switch, Fan Auto or Fan On switch. Optional status indication LED lights, System On, Heat, Cool, and Service shall be available. This sensor shall be used with CV & SZVAV units.
- Programmable Night Setback Sensor shall be electronic programmable with auto or manual changeover with 7 day programming. Keyboard shall provide selection of Heat, Cool, Fan Auto or On. All programmable sensors shall have System On, Heat, Cool, Service LED/ indicators as standard. Night setback sensors shall have (1) Occupied, (1) Unoccupied and (1) Override program per day. Sensors shall be available for CV zone temperature control and VAV Supply Air temperature control.
- VAV Zone Sensor shall be provided with supply air single temperature setpoint and AUTO/ OFF system switch. Status indication LED lights shall include: System On, Heat, Cool and Service. Sensor shall be provided for zone temperature control with VAV units. VAV units are not compatible with SZVAV units.
- Remote Sensor shall be available to be used for remote zone temperature sensing capabilities when zone sensors are used as Remote panels.
- Fast Warm-Up Sensor shall be used as Morning warm-up sensor with VAV units.
- Integrated Comfort System sensors shall be available with sensor only, sensor with timed override, and sensor with local temperature setpoint adjustment with timed override.
- Remote Minimum Position Potentiometer shall be available to remotely adjust the minimum position setting of the unit economizer.
- AirFi™ Wireless Zone Sensor shall be available with a RF wireless zone temperature, setpoint and timed override transmitter and a RF receiver that connects directly to the IntelliPak 2 controller and uses spread spectrum technology. Option includes sensor, receiver wiring harness and (2) AA lithium batteries. Sensor battery life shall provide at least 5 years life under normal operating conditions and shall provide a readily visual indication of battery condition.

CO_2 (Carbon Dioxide) Sensing

The CO_2 sensor shall have the ability to monitor space occupancy levels within the building by measuring the parts per million of CO_2 in the air. As the CO_2 levels increase, the outside air damper modulates to meet the CO_2 space ventilation requirements.

Humidity Sensor

This wall or duct-mounted humidity sensor shall be used to control activation of the hot gas reheat dehumidification option. The humidity sensor can be set for humidity levels between 40% and 60% relative humidity

High Duct Temperature Thermostats

Two manual reset thermostats shall be provided with one located in the discharge section of the unit set at 240°F and the other in the return section set at 135°F. The rooftop shall shut down if the thermostats are tripped.

Trane Startup

A Trane technician will provide unit startup after the unit is properly installed. The installation must include:

- Unit and all ship-with items installed
- All utilities and drain pipes connected
- All refrigerant piping reconnected and all refrigerant charge adequately distributed throughout the system
- All ductwork attached to the unit

Prior to Trane Unit Startup

Prior to Trane startup, the following work should be inspected and verified:

Evaporative Condenser

Review the Multi-piece units section for refrigeration hookup. Review the water system to ensure that the fill valve is properly set and the drain timing is set properly for the given application. Verify the condenser fan shipping supports have been removed.

Unit inspection - cabinet

Review the overall unit for exterior damage (dents, bends, missing panels, doors working properly, etc). Verify the unit interior is free from debris/obstructions, the panels and doors are secured properly, the unit clearances are adequate to avoid air recirculation, and that the unit drain lines and traps are properly installed.

Wiring

Review the unit main power to ensure that the unit is properly grounded, the main power feed wire gauge is adequately sized, the correct voltage is supplied to the unit and electric heaters (if applicable), and the incoming voltage is phase balanced. Verify that all wiring connections are tight, all field installed control wiring is landed on correct terminals, and that all automation and remote controls, along with control wiring for CV and VAV controls, are correctly installed/wired.

Refrigeration system

Review the refrigeration system to ensure the coil fins are straightened, shipping hardware and plastic covers for compressors have been removed, compressors contain the correct oil level, service valves are in the correct position, and the crankcase heaters have been operational for at least 12 hours prior to Trane startup.

Fans

Check the unit fans to ensure the condenser fan blade set-screws to the motor shaft are tight, hold down bolts and channels from fan sections have been removed, proper adjustment of fan section spring isolators, proper fan belts tension, adequate fan bearings greased, alignment of fan sheaves, adequate tightness of supply and exhaust fan pulley bolts, proper fan rotation, and proper fan motor amperage.

Multi-piece units

Check to ensure both piping to the condenser and air handler side of the system have been completed and interconnecting refrigerant tubing has been evacuated. Verify base rail connection points. Inspect and verify wiring connection points related to multi-piece units.

Economizer

Check all damper linkages for proper adjustment. Verify proper damper operation and outside air pressure sensors. Electric Heat On units equipped with electric heaters, check to ensure the heating system matches the unit nameplate and verify that the correct voltage is supplied to the heaters.

Hot Water/Steam

On units equipped with hot water heat, check and verify the following: hot water pipes are properly routed, sized and leak free; the presence of swing joints or flexible connectors next to the hot water coil; proper gate valve installation in the supply and return branch line; proper three way modulating valve installation, and proper coil venting. On units equipped with steam heat, check and verify the following: hot water pipes are properly routed, sized and leak free; proper swing check vacuum breaker installation; proper 2-way modulating valve installation; and proper steam trap installation.

Gas Heat

On units equipped with gas heaters, check to ensure that the flue assembly is secure and properly installed, sufficient gas pressure exists at the unit, no leaks exist in gas supply line, the gas heat piping includes a drip leg, and condensate line is run if required.

Trane Unit Startup

After the unit installation has been fully completed, a Trane technician will do the following:

- Verify and log supply fan operation, proper compressor operation, and condenser fan operation, as well as correct levels of superheat and subcooling.
- Verify operation of all VAV modes per job requirements, which include: Supply Air Cooling and Heating, Daytime Warmup, Morning Warmup, and Supply Air Tempering.

Evaporative Condenser — Verify the sump fill level, set blow-down interval and duration per customer requirement.

Return Fan — Establish the return fan maximum setpoint based on the required building pressure setpoint.

Space pressure control — Verify that unit is sensing field installed building pressure input.

GBAS 0-5 &0-10 VDC — Verify that inputs are set up and functional per customer requirement.

Ventilation override — Verify that sequences are set up and functional per customer requirement.

Economizer — Adjust outside air travel and verify all sensor inputs.

Dehumidification — Verify that dehumidification mode operates correctly and is set up per job requirements.

Outside Air Measurement — Verify that there is correct Traq damper linkage and actuator operation, as well as matched left and right air flow. Verify that Demand Flow Ventilation function is correct.

Gas Heat — Startup gas heat per the unit Installation, Operation, Maintenance Manual (IOM) and record CO_2 and O_2 levels.

Energy Recovery — Check to ensure proper rotation and operation of the wheel. Use the service test guide in the unit Installation, Operation, Maintenance Manual (IOM) to operate unit components.

All units — Verify Human Interface programming, including setpoints and sensor sources per customer requirements. Leave the unit in a running state or off per customer requirement. Once the IntelliPak 2 unit startup is complete, provide a startup activities communication and the associated operating log.

Notes

Ingersoll Rand (NYSE: IR) advances the quality of life by creating comfortable, sustainable and efficient environments. Our people and our family of brands — including Club Car®, Ingersoll Rand®, Thermo King® and Trane® — work together to enhance the quality and comfort of air in homes and buildings; transport and protect food and perishables; and increase industrial productivity and efficiency. We are a global business committed to a world of sustainable progress and enduring results.
